## NOTICE OF DECISION

Secretary of Labor v. CARL NOSSER, d/b/a NOSSER CONSTRUCTION
OSHRC Docket No. 80-6646

1. Enclosed is a copy of my decision. It will be filed with the Commission on February 1, 1982, and will become the final order of the Commission on March 3, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is March 3, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

## DECISION AND ORDER

Appearance:

T. TIMOTHY RYAN, Esq., Solicitor of Labor
HERMAN GRANT, Esq., Regional Solicitor,
CYRUS A. ALEXANDER, Esq., Office of the Solicitor,
Chicago, Illinois, for Raymond J. Donovan, Secretary
of Labor, U.S. Department of Labor, Complainant.

CARL NOSSER, pro se, for Respondent.

BOBRICK, Judge

This proceeding was commenced pursuant to Section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651, et seq., (hereinafter referred to as the Act), wherein Respondent, Carl Nosser, d/b/a Nosser Construction, contested the penalty provisions of certain Citations issued by Complainant, Raymond J. Donovan, Secretary of Labor, U.S. Department of Labor. The Citation charged Respondent with serious violations of the construction standards and proposed penalties for such violations as follows: Item 1, 29 C.F.R. 1926.28(a) - $200.00; Item 2(a)-(c),

29 C.F.R. 1926.400(a), Section 110-17(a), National Electrical Code, NFPA 70-1971, 29 C.F.R. 1926.400(h)(1) and 29 C.F.R. 1926.401(a)(1) - $200.00; Item 3, 29 C.F.R. 1926.450(a)(9) - $200.00; Items 4(a) and 4(b), 29 C.F.R. 1926.451(a)(4) and 29 C.F.R. 1926.451(a)(8) - $320.00.

Trial was held in this matter on October 22, 1981, at the completion of which a Decision and Order was announced.

The Secretary in its Citations has proposed the aggregate sum of $920.00 in penalties. While I find that the Secretary's rational and purpose in proposing that amount was fully justified and supportable in law (Tr. 13-18), a penalty in the aggregate of $300.00 appears more appropriate (Tr. 55). St. Joe Minerals Corp., d/b/a St. Joe Lead Co.-Smelting Division, CCH 1981 OSHD para. 25,644.

By reason of the size of the business of the employer, the gravity of the violation, the good faith of the employer and the history of previous violations, and considering the economic realities of times in which we live, the following penalties as set forth below are assessed (in which both Respondent and Complainant concur as being reasonable and appropriate (Tr. 55).

## ORDER

Based upon those reasons set out in my Decision and Order, and for good cause shown, it is ORDERED:

(1) A penalty of $50.00 is assessed for Item 1.

(2) A penalty of $50.00 is assessed for Item 2.

(3) A penalty of $100.00 is assessed for Item 3.

(4) A penalty of $100.00 is assessed for Item 4.

Mr. Billy C. Lewis, President, International Brotherhood of Electrical Workers, Local Union No. 301, Nash, Texas, on behalf of authorized employee representative

## DECISION AND ORDER

BURROUGHS, Judge: Respondent, B & W Construction Company, contests an alleged serious violation of 29 C.F.R. § 1926.451(a)(4) for failing to install standard guardrails on a platform erected approximately 41 feet above a concrete

floor. The serious citation was issued on April 9, 1981, and resulted from an investigation conducted at the Southwestern Electric Power Company's ("SWEPCO") plant at Cason, Texas, on March 30, 1981.

Respondent is one of the nation's largest companies engaged in the manufacture and construction of both nuclear and fossil-fueled power generation equipment. It had contracted with SWEPCO to perform certain repair work at SWEPCO's plant at Cason, Texas. One of the repair projects undertaken by respondent involved the removal of cables from a cable tray located near the plant's turbine room. The middle of three parallel cable trays had been damaged by fire and approximately one hundred cables had to be removed, new cable laid and terminated at two junction boxes.

The general description and location of the burned cable tray is undisputed. A flight of permanent stairs leads from the floor above to a permanent platform adjacent to the plant's turbine room door. The platform is approximately four feet by five feet and is midpoint to three tiers of cable trays. The three trays are located to the left of the permanent platform and run horizontally parallel to each other for approximately 45 to 50 feet (Tr. 107). The bottom cable tray makes two 45-degree angles at the platform area and then parallels the top two trays to the right of the permanent platform for another 45 feet (Tr. 107).

Each cable tray is supported by steel unistruts. The vertical distance between unistruts is approximately 12 inches from the bottom of one unistrut to the top of the above unistrut, or six inches when measured from the top of the lower unistrut to the bottom of the above unistrut (Exs. 1, 3, B; Tr. 34, 107, 131). The unistruts are supported by 5/8-inch vertical steel hanger rods (Exs. 1, 3, B; Tr. 19, 107). The hanger rods are suspended from a 24-inch I-beam that parallels the cable

trays and is attached to the ceiling (Ex. A; Tr. 107, 109, 131). The first unistrut was located 30 inches below the bottom of the I-beam (Ex. A; Tr. 107, 128-131).

There is no dispute over the fact that on March 16, 1981, Andy W. Jones, respondent's job superintendent, discussed the cable repair job with A. D. Donaldson, foreman of the electrical work, and instructed Donaldson to build a scaffold to facilitate the repairs. Seven electricians had reported to the site on that date to commence the job and Donaldson assigned three of them, Pate, Ellison and Terry, to construct the scaffold. It was agreed that the scaffold would be constructed with 2-inch by 12-inch boards secured to the unistruts located to the left of the permanent platform and that the bottom cable tray would provide an adequate runway to the right. The 2-inch by 12-inch boards were placed in position and secured to the unistruts. A dispute arises as to whether the boards were erected on top of the middle unistrut, as opposed to the bottom unistrut, and whether there was one or two guardrails.[1/] The determination of these factual questions involves an issue of credibility between Morris Pate and Andy Jones.

On March 16, 1981, a Monday, Morris Pate, Jr., a journeyman electrician, reported to work at SWEPCO's Cason, Texas, plant for purposes of repairing the damaged cables (Tr. 63). He was assigned to the job by A. D. Donaldson, and Donaldson explained to him what had to be done. Donaldson showed Pate the scaffolding materials and instructed him to construct a scaffold so the job could be accomplished (Tr. 64). According to Pate, Donaldson did not specify how he wanted the scaffold constructed but told him to make it as safe as he could (Tr. 64). Pate, with the assistance of two other electricians, constructed the scaffold. These facts are undisputed.

---

1/ The adequacy of the bottom cable tray as a runway and the adequacy of the 2-inch by 12-inch boards are not in issue.

Pate testified that he constructed the scaffold on the bottom unistrut (Tr. 67, 85) and looped a 5/8-inch manila rope around the steel hanger rods above the top unistruts to serve as a guardrail (Tr. 68, 71, 94, 101). He stated that he tied only one rope around the scaffold (Tr. 69, 101). The top unistrut prevented the rope from slipping down the hanger rod (Tr. 71). Pate indicated that the rope around the scaffold could be pulled a distance of six to eight inches (Tr. 71, 95-96).

Respondent's job superintendent, Andy W. Jones, testified that on March 13, 1981, he discussed the cable tray repair job with A. D. Donaldson, foreman of the electrical work who was referred to the job by the union (Tr. 112). His next discussion with Donaldson took place on March 16, 1981. On that date, Jones took Donaldson to the area and discussed the building of a scaffold to accomplish the job. Jones instructed Donaldson to have the scaffold erected in a safe manner. He pointed out the boards available for use and told Donaldson to use a 5/8-inch manila rope for the guardrails (Tr. 112, 165). Donaldson and Jones concur in their recollection of the facts up to this point, but subsequent events are not remembered by Donaldson.

As the scaffold was being erected, Jones, according to his testimony, observed it from the ground and reminded Donaldson that it was not to be used until it was safe. He also asked that Donaldson inform him when the scaffold was completed so that he could inspect it (Tr. 113). According to Jones, on the morning of March 17, 1981, he and Donaldson went to the area and walked out on the permanent platform adjacent to the plant's turbine room door. Jones noticed that the scaffold had only one rope tied about six inches above the top unistrut. Jones testified that he informed Donaldson that he needed two guardrails and that he instructed Donaldson to place a second rope around the scaffold and to call him when it was erected (Tr. 113, 138-139). According to Jones, Donaldson later called

him to advise that both guardrails were in place and that they were tight (Tr. 114). Jones stated that later in the day he looked at the scaffold and observed that two guardrails had been erected and were tight.[2/] He reached out and grabbed the rope on the left side but only observed the rope on the right side (Tr. 122-123). According to him, the ropes did not deflect more than two inches (Tr. 115-116, 122, 139). He then told Donaldson to have the men go to work. Jones indicated that he continued to observe the scaffold from time to time while it was in place and that it always had two guardrails (Tr. 117-118).

Donaldson testified that Jones looked over the job with him and instructed him to build the scaffold. He remembers no discussion of guardrails but does remember that Jones told him to make the scaffold safe (Tr. 165). After the scaffold was constructed, Donaldson indicated that Jones came and talked with him about the scaffold and inquired if there was anything else the men needed to make the scaffold safe (Tr. 165-166). Donaldson says he informed Jones that the men had the scaffold like they wanted it (Tr. 166). Donaldson further testified that he did not see Jones go up to the platform and check the guardrails (Tr. 166). He could not remember if Jones ever told him that one guardrail was unsafe (Tr. 166). While Donaldson was able to testify precisely with regard to specific facts, the clarity of his answers seemed to dissipate when afforded an opportunity to directly confront testimony given by Jones.

Donaldson initially testified that there was only one rope used to provide one guardrail (Tr. 166). When asked if there could have been two ropes, he replied that he could not answer the question (Tr. 166). Later he indicated that he would not swear that there was not a second rope. He conceded that it was possible a second

---

2/ Jones did not actually climb onto the scaffold but observed it from the permanent platform (Tr. 122).

rope was in place (Tr. 173). He testified that he made a visual check of the scaffold and seemed sure the rope had some sag in it over a period of time (Tr. 168-170). He later hedged his testimony by saying he truthfully could not recall if it was taut at times. He then indicated he could not remember one way or the other (Tr. 170). Donaldson conceded he made a visual check of the scaffold (Tr. 168) but did not seem to remember any facts that would place him in direct conflict with the testimony of Jones. Donaldson testified that he believed the scaffold was constructed on the bottom unistrut but conceded it could have been constructed on the second unistrut as contended by Jones (Tr. 168).

Billy Lewis reported to the work site on March 19, 1981, and was later named job steward for the union. The cable tray repair job had been in progress for three days when he reported to the work site (Tr. 40). While Lewis did not work on the cable tray, he testified that he passed by the cable trays two or three times a day (Tr. 40-41). He declined to categorically testify that there was only one guardrail. His responses to the questions concerning the number of guardrails were unusually vague. He testified (Tr. 41-42):

> Q. Did you observe whether there was a handrail or handrails on the scaffolding itself made out of five/eighths inch manila rope?
>
> A. I know there was a rope handrail.
>
> Q. How many handrails did you observe? How many handrails did you see?
>
> A. As far as saying for sure, I could not say. I know there was at least one.

Lewis later testified that he did not know OSHA standards and that the scaffold "could have or it could not have been an OSHA approved scaffolding" (Tr. 44). This statement seems incredulous since Lewis acknowledged that as union steward he had some responsibility for safety at the job (Tr. 42-43).

Lewis testified that he and A. D. Donaldson discussed the scaffold and that they both felt it was safe (Tr. 45, 56, 58). Donaldson further testified that it was emphasized "all down the line" to be sure the scaffold was safe and for no one to get on it until it was safe (Tr. 172). Pate acknowledges that Donaldson instructed him to make the scaffold as safe as he could (Tr. 64). Pate had knowledge of the requirements of scaffolds. He conceded that he had been a foreman on construction jobsites and had constructed approximately a dozen scaffolds in the last four years. He was aware that OSHA requirements necessitated a top rail and a midrail on scaffolds (Tr. 84, 99-100). He also acknowledged that whenever he observed a condition he believed to be unsafe, he tried to take steps to see that the condition was corrected (Tr. 84-85). According to him, he made the scaffold as safe as he could and that he considered it safe (Tr. 76).

The preponderance of the evidence mandates that the issues of credibility be resolved favorably to respondent. Jones explicitly testified that the scaffold was constructed on the middle unistrut and that two manila rope guardrails were erected around the scaffold. It is significant that Lewis and Donaldson, both members of the union and serving as job steward and electrical foreman for the job, failed to corroborate Pate's testimony on the essential facts in issue. Lewis and Donaldson had an opportunity to visually observe the scaffold several times a day but were unable or unwilling to testify that the scaffold had only one guardrail.

Pate's testimony that the platform was constructed on the bottom unistrut is inconsistent with his testimony of the distance from the platform to the ceiling. He testified that there was less than six feet from the platform to the ceiling. He indicated that he was six feet tall and had to turn his head to one side when he stood erect on the platform (Tr. 88). If the platform had been located on the bottom unistrut, the distance from the platform to the ceiling would have exceeded

six feet.[3/] The distance would have been less than six feet if the platform had been erected on the second unistrut as contended by Jones.

A decision in this matter adverse to respondent will result in a pecuniary benefit to Pate. This result arises from the fact that the union contract contained an unusual clause that provided for employees to be paid at one and a half times the hourly rate if employees worked on a scaffold at a height of over 40 feet and the scaffold did not comply with OSHA requirements (Tr. 43-44, 49-50). The question of whether the scaffold was constructed in conformity with OSHA standards did not arise until Lewis asked Pate whether he had been paid the "high time" rate for his work on the scaffold. The men working on the scaffold had been paid on Friday, March 20, 1981 (Tr. 54), and sometime thereafter Lewis asked Pate about the matter. According to Lewis, he raised the question because he wanted to agitate Pate. He further testified that when he raised the point, he had no opinion whatsoever at that time as to whether the scaffold was safe (Tr. 55). Once the issue was raised, he indicated that he discussed the matter with Donaldson and that both of them considered the scaffold to be safe (Tr. 45).

Since representatives of the company were of the opinion that the scaffold was safe, the union filed an employee complaint with OSHA in order to obtain a ruling as to whether the scaffold complied with OSHA standards. The sole motivation for filing the employee complaint was economic. It was initiated in an effort to obtain the 50 percent additional "high time" pay. There seems to have

---

3/ A 24-inch I-beam attached to and supporting the ceiling ran parallel to the cable trays. There was a distance of 30 inches from the bottom of the I-beam to the top of the top unistrut. There was a distance of approximately 12 inches from the bottom of one unistrut to the top of the above unistrut. This means that there was approximately two feet from the bottom unistrut to the top of the top unistrut.

been little concern for safety since the complaint was not made until the scaffold was disassembled. When Compliance Officer Walter C. Hogan, Jr., conducted his investigation on March 30, 1981, he had to rely on representations made to him since he could not visually observe the scaffold.

There is considerable discussion in the record as to whether there was one or two platforms erected in the area of the cable trays. According to Jones and Lloyd Russell, the superintendent relieving Jones on Friday, March 20, 1981, the platform erected to repair the cable trays was removed from the unistruts on March 20, 1981[4/] (Tr. 118, 141-142, 144, 156). Russell testified that a smaller platform was erected to permit the electricians to attach a junction box onto a perpendicular I-beam above the cable trays (Tr. 142, 146). Russell indicates the second scaffold went up on Monday, March 23, 1981, and was taken down on Wednesday, March 25, 1981 (Tr. 146, 148). Pate testified that the one scaffold remained erected until Wednesday, March 25, 1981, and that there was no second scaffold (Tr. 71-72).

Whether there was a second platform has no direct relationship to the alleged violation of 29 C.F.R. § 1926.451(a)(4). The citation was issued with respect to the scaffold constructed on March 16, 1981, by Pate with the assistance of two other electricians. The second platform dispute crept into the record in an effort by both parties to buttress their argument as to the credibility of their witnesses. Jones and Russell testified there were two separate platforms while Pate testified that the one platform was used to repair the cable trays and to install the new junction box. The resolution of this particular conflict is not essential to the determination

---

4/ Jones was assigned for a few days to another job because of his expertise in working with nuclear plants (Tr. 119). Russell testified that he was assigned to work at the SWEPCO plant in Cason, Texas, on March 20, 1981, and continued on the job through March 26, 1981 (Tr. 141). Jones returned to the SWEPCO plant on March 26, 1981 (Tr. 119).

of the issue in dispute. If the platform was not disassembled until March 25, 1981, as contended by Pate, then the delay in contacting OSHA served no purpose except to deny the compliance officer the opportunity to observe the scaffold.

All witnesses testifying in this matter expressed the opinion that the scaffold provided a safe work environment (Tr. 45, 56, 85-86, 165-166). Even Pate testified that the scaffold was safe (Tr. 76). Jones testified that no complaint was made to him concerning the safety of the scaffold (Tr. 119), and there is no evidence to contradict his testimony.

The citation alleges a failure on the part of respondent to comply with the provisions of 29 C.F.R. § 1926.451(a)(4),[5/] which requires guardrails and toeboards on all open sides more than ten feet above the ground or floor. Section 1926.451(a)(5)[6/] states that the guardrail shall be approximately 42 inches high with a midrail and specifies that guardrails shall be 2 inches by 4 inches "or the equivalent." The term "or the equivalent" has been interpreted by OSHA Program Directive #100-58 to include the use of synthetic, fiber or wire ropes as rails when

---

5/ Section 1926.451(a)(4) provides:

> Guardrails and toeboards shall be installed on all open sides and ends of platforms more than 10 feet above the ground or floor, except needle beam scaffolds and floats . . . . Scaffolds 4 feet to 10 feet in height, having a minimum horizontal dimension in either direction off less than 45 inches, shall have standard guardrails installed on all open sides and ends of the platform.

6/ Section 1926.451(a)(5) states:

> Guardrails shall be 2- x 4-inches, or the equivalent, approximately 42 inches high, with a midrail, when required. Supports shall be at intervals not to exceed 8 feet. Toeboards shall be a minimum of 4 inches in height.

they meet certain guidelines.[7/] The new 5/8-inch manila rope[8/] used by Pate satisfies the equivalency requirement.

The bottom of the I-beam was located approximately 42 inches above the platform. This fact is undisputed (Tr. 89-90). The I-beam functioned as a top rail since the bottom of the I-beam was located at a height of 42 inches above the platform and extended to the ceiling. The rope located above the top unistrut functioned as a midrail. There is agreement among all witnesses that a rope was located above the top unistrut. Jones testified that the top rope was located approximately six inches above the top unistrut. The second rope was approximately four inches below the top unistrut (Tr. 115, 128). This means that the top rope was approximately 18 inches above the platform. The second rope would

---

7/ OSHA Program Directive #100-58 provides, in pertinent part:

4. Action

a. The use of chain and synthetic, fiber, or wire ropes as top rails and intermediate rails of guardrails used on scaffolding meets the equivalent requirements of 1926.451(a)(5) when in compliance with the following guidelines.

(1) Rope or chain shall be secured to each support and taut at all times. It may be necessary to use a positive tensioning device to reduce the sag or catenary to a minimum.

(2) The rope or chain shall be free of sharp edges, burrs, or projections which may be a hazard.

(3) The maximum deflection of the top rail when a load of 200 pounds is applied in any direction at any point on the top rail shall not exceed 3 inches in one direction which includes the free hanging sag in the rope or chain.

8/ Pate testified that the 5/8-inch manila rope used as a guardrail was new.

have been just barely above the platform since there was only a distance of approximately 12 inches from the bottom of one unistrut to the top of the above unistrut. The cited standard did not necessitate a second rope being placed below the top unistrut; however, this does not mean that the second rope served no purpose. Pate testified that employees worked from a seating position (Tr. 96), and the second rope would have provided additional protection to employees. Whether there was a second rope below the top unistrut, as contended by Jones, is immaterial since the top rope functioned as a midrail.

There is also a dispute as to how taut the top rope was pulled around the scaffold. Jones testified that he checked the rope and found it to be taut. He also observed it each day and found it to be tightly drawn. While Pate indicated that the rope would on occasion give six to eight inches, he also testified that the electricians checked it at least daily and would retighten it (Tr. 71). Since daily checks were made on the tautness of the tope and it was retightened when necessary, there was compliance with the standard. The alleged violation is vacated.

## FINDINGS OF FACT

1. On March 30, 1981, Compliance Officer Walter C. Hogan, Jr., conducted an investigation of respondent's work site at the SWEPCO power plant near Cason, Texas. The investigation resulted from a complaint filed by the business agent of Local 301 of the International Brotherhood of Electrical Workers (Tr. 16-17). The complaint alleged an unsafe condition existed in regard to a scaffold erected at the site (Tr. 17).

2. The scaffold had been removed prior to Compliance Officer Hogan arriving at the work site on March 30, 1981 (Tr. 17, 24, 35).

3. Respondent had contracted to perform certain repair work at the SWEPCO plant at Cason, Texas (Tr. 105-106). One of the jobs involved the repair of a cable tray near the plant's turbine room. The middle of three parallel cable trays had been damaged by fire and approximately one hundred cables had to be removed, replaced and terminated at two junction boxes located on the floor above the trays (Tr. 106).

4. The cable trays are supported by steel unistruts. The vertical distance between the unistruts is approximately 12 inches from the bottom of one unistrut to the top of the above unistrut, or six inches when measured from the top of the lower unistrut to the bottom of the above unistrut. The unistruts are supported by 5/8-inch vertical steel hanger rods which are located approximately six feet apart. The hanger rods are suspended from a 24-inch I-beam that parallels the cable trays and is attached to the ceiling above the cable trays (Exs. 1, 3; Tr. 19, 34, 129-131).

5. In order to repair the damaged cables, it was necessary to erect a scaffold. A scaffold consisting of 2-inch by 12-inch boards was secured on top of the middle unistrut on March 16, 1981, by Morris Pate, Jr., and two other electricians. The boards were overlapped and tied together by number nine wire (Tr. 37, 64-65, 112, 114-115, 124, 131, 138).

6. The scaffold was constructed approximately 41 feet above a concrete floor (Tr. 17-18, 22).

7. Two guardrails consisting of 5/8-inch manila rope were erected completely around the scaffold. The top guardrail was placed around the hanger rods approximately six inches above the top unistrut. A second rope was placed around the hanger rods approximately four inches below the top unistruts (Tr. 68-69, 112-113, 115).

8. The ropes used as guardrails were tightly drawn to prevent sag (Tr. 116). The ropes were checked at least daily to insure that they were tightly drawn. The electricians retightened the ropes whenever any sag was observed (Tr. 71).

9. The 24-inch I-beam located parallel to the scaffold was approximately 42 inches above the platform (Tr. 89-90, 116).

10. The scaffold was removed from the unistruts on Friday, March 20, 1981 (Tr. 118).

## CONCLUSIONS OF LAW

1. Respondent, at all times material hereto, was engaged in a business affecting commerce within the meaning of section 3(5) of the Act.

2. Respondent, at all times material hereto, was subject to the requirements of the Act and the standards promulgated thereunder. The Commission has jurisdiction of the parties and of the subject matter herein.

3. Respondent did not violate 29 C.F.R. § 1926.451(a)(4) since the scaffold erected on March 16, 1981, at the SWEPCO plant located in Cason, Texas, complied with the requirements of sections 1926.451(a)(4) and (a)(5).

## ORDER

Based upon the foregoing findings of fact and conclusions of law, it is

ORDERED: That the serious citation issued to respondent on April 9, 1981, is vacated.

Dated this 1st day of February, 1982.

## NOTICE OF DECISION

Secretary of Labor v. Bowman Handles, Inc.
OSHRC Docket NO. 81-2102

1. Enclosed is a copy of my decision. It will be filed with the Commission on February 1, 1982, and will become the final order of the Commission on March 3, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D. C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is March 3, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed portcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92 and 93.

## DECISION AND ORDER

SCHWARTZ, Judge:

This is a proceeding brought before the Occupational Safety and Health Review Commission ("The Commission") by the Secretary of Labor ("The

Secretary"). Bowman Handles, Inc. ("The Respondent") contests several items of a serious citation and one item of a non-serious citation. A hearing was held on January 5, 1982, in Batesville, Arkansas. Mr. John L. Fulcher, representing the employees at Bowman Handles appeared on behalf of the employer. The Secretary withdrew item 4 of serious citation number 1 and deleted the proposed penalty of $200 for item 5 of the serious citation at the hearing. The remaining issues involve alleged saw guarding violations set forth at items 1, 2, and 3 of serious citation number 1 and item 3 of non-serious citation number 2.

I

DISCOVERY

Respondent requested an immediate hearing in this matter representing that the pending OSHA citations had caused its buyers to delay their semi-annual orders for fear Bowman Handles, Inc. would be out of business. This position was again advanced at the hearing. Congressman Bill Alexander also requested an expedited hearing on behalf of his constituent. Chief Judge Tenney indicated to Congressman Alexander that the Commission is sensitive to the fact Respondent is a small business and is appearing without counsel. Judge Tenney noted that the Respondent would receive a prompt hearing. The case was assigned to me on December 10, 1981.

In reviewing the file, I noted that the Secretary had requested to enter Bowman Handles for another inspection by outside experts. The date requested was January 5, 1982. I denied the request in an order dated December 15, 1981. My order is attached hereto as Appendix "A".

The Secretary has objected to the order. One objection concerns a conversation with my secretary about the setting of the case for January 5, 1982.

Labor indicates that it did not agree to this hearing date after it became known that its entry upon land would not be permitted. The undersigned finds this to be a minor point. However, I have no problem with amending my order to delete the second sentence in view of Labor's understanding of the conversation.

The Secretary's major objection is that it sought entry of its experts to properly prepare on the affirmative defense issues of impossibility of compliance and greater hazard. The Secretary contends that because he was denied entry he could not properly prepare for the hearing. I disagree. The date of January 5, 1982, was not selected at random. It was selected by me because the Secretary had chosen this date for his experts' reinspection of the workplace. Consequently I felt they would be available for the expedited hearing on that date. In fact, the Secretary presented his expert as a rebuttal witness. The witness had the opportunity to listen to the entire trial testimony, review all the exhibits and give his opinions at the hearing. In my view I protected the Secretary's rights by selecting the date of January 5, 1982, and allowing opinion testimony in the manner set forth above. My reasons for denying the Secretary's motion for entry upon land are reaffirmed and incorporated into this decision.

## INSPECTION

Respondent has raised, in layman's terms, the question of the legality of the Secretary's inspection. The Secretary takes the position that the question of the scope and method of the inspection is not relevant to the subject proceeding. He objected to the introduction and development of this area. The undersigned overruled his objections and developed the issue. First I had the Secretary and Respondent agree to the events leading up to the actual inspection. I also had documents such as the warrant, supporting affidavit, employee complaint, and

letters introduced as judge's exhibits in the case. The record reflects the following events up to and including the date of the inspection on July 16, 1981.

On January 29, 1981, OSHA made its first attempt to inspect Bowman Handles, Inc. It was a general schedule inspection. Entry was refused by Eldon Bowman, the brother of Mr. Lynn Bowman. Eldon Bowman is the plant superintendent and runs the place when Lynn Bowman is away (T. 222-223). The second contact with Bowman Handles was on February 24, 1981, when another attempt for a general schedule inspection was made by Compliance Officer Rogers. Mr. Lynn Bowman refused entry on that date (T. 223).

The Secretary indicated, without waiving his objection, that OSHA received a complaint letter from an employee of Bowman Handles. This letter was made a part of the record as Judge's exhibit number 4. It was received by the OSHA Little Rock, Arkansas office on June 16, 1981 (T. 224; Judge's Exh. 4). The record also reveals that a complaint form was filled out by the same employee and received by the Little Rock office on June 23, 1981 (Judge's Exh. 3).

The Secretary prepared an affidavit and applied for an inspection warrant pursuant to the Act. The affidavit indicated that the establishment was scheduled for a programmed safety inspection pursuant to a scheduling system based upon objective selection criteria (Judge's Exh. 2). A United States Magistrate issued an inspection warrant to enter the employer's workplace (T. 224; Judge's Exh. 1) The warrant was issued on July 7, 1981. On July 8, 1981, the Secretary's compliance officer served the inspection warrant on Mr. Lynn Bowman and was denied entry to the workplace (T. 225). On July 16, 1981, the compliance officer returned to the site and conducted the subject inspection (T. 255).

Mr. Bowman testified concerning his first encounter with Ms. Marcie Twyford a staff member of Congressman's Bill Alexander's Batesville staff. He indicated

that Ms. Twyford was brought into the matter after his employee Mr. Alvin Light went to her about keeping the plant open. Mr. Bowman was considering closing the plant after reading the numerous items contained in the employee complaint. The employee complaint was served at the same time Mr. Rogers presented the warrant. Ms. Twyford contacted him after the warrant had been served on him and the compliance officer was refused entry. Ms. Twyford asked why he felt that he would be in so much trouble if OSHA came in . He explained his feelings and Ms. Twyford called the OSHA Area Director in Little Rock. She then called Mr. Bowman back and asked if they could come in, make an inspection, and not fine him the first time through. Mr. Bowman had no problem with this procedure. Ms. Twyford then called back and told Mr. Bowman that OSHA agreed to this procedure on the telephone. The compliance officer, Mr. Rogers, came back at Respondent's request and the inspection was conducted. The subject citations and proposed penalties were then issued. Mr. Bowman called the Area Director and mentioned the understanding of no fines the first time through. The Area Director told him that he never made such a statement (T. 233-236).

Ms. Marcie Twyford appeared and testified on behalf of the employer. She indicated that she is a staff member of Congressman's Bill Alexander's Batesville Office. She testified that she had indeed relayed the no penalty inspection information to Mr. Bowman. It was her understanding, a verbal understanding, that OSHA would agree to come in without penalty on an inspection. She had a number of conversations with the Area Director. Normally her office does things by letter. However, she was trying to expedite things, move it along and get Mr. Bowman back into operation. It was her testimony that the Area Director told her if Mr. Bowman would agree to the entry, there would be no penalty. Her plea to the Area

Director was to let Mr. Bowman take the penalty money and apply it toward the safeguards that were being requested. She relayed the information that the inspection would be made without penalty to Mr. Bowman (T. 239-240).

The Secretary is essentially asserting that the Commission is precluded from reviewing a magistrate's probable cause determination or any aspect of the inspection conducted pursuant to the warrant issued by the magistrate in this case. I disagree. The Commission has set forth its authority, in no uncertain terms, to address inspection warrant issues. Chromalloy American Corp., 79 OSAHRC 55/D11, 7 BNA OSHC 1547, 1979 CCH OSHD ¶23,707 (No. 77-2788, 1979); Sarasota Concrete Company, 81 OSAHRC 48/A2, 1981 CCH OSHD ¶25,360 (No. 78-5264, 1981), Pet. For Review Filed, No. 81-5621 (5th Cir. June 23, 1981). The burden of proof is on the party seeking to suppress the evidence. The Respondent must show that the inspection failed to conform with fourth amendment requirements. The Commission has also held that that the exclusionary rule is applicable to its proceedings. This means that any illegally seized evidence must be excluded in hearings conducted under the Act. Sarasota Concrete, supra.

The facts in this case must be reviewed within the guidelines of these cases. Mr. Bowman has not used terms such as lack of consent, invalid inspection, deception, or exclusion of evidence. He is a small businessman and not a lawyer. Nevertheless his position became clear to the undersigned judge two-thirds of the way through the hearing. I realized that there was definitely a warrant problem in this case. Consequently, I began developing the record to insure a fair and complete picture of the events leading to the contested citations. I overruled the Secretary's objections that the issue was not relevant. The case law set forth above supports these rulings. Mr. Bowman's major contention concerning the

warrant inspection of his workplace is that he was misled into permitting the inspection by the Area Director. Stated another way, he consented to allow the compliance officer into the workplace because the Area Director, through Ms. Twyford, promised no penalty would be issued.

The record is clear that absent such a promise, Mr. Bowman intended to fight the warrant inspection. He refused entry on July 8, 1981, when the compliance officer presented the warrant and the employee complaint. He believed that the warrant was based on the employee complaint rather than the criteria set forth in the warrant. He based this belief on the fact that the scheduled inspections were in January and February 1981. The complaint was filed in late June and the Secretary first sought a warrant on July 7, 1981.

It is without question that Mr. Bowman had the absolute right to refuse entry when served with the warrant. He had the right to require the Secretary to institute contempt proceedings. He could then attempt to convince a Federal District Judge that the warrant for the inspection was illegal. He gave up this right and allowed the Secretary to inspect his workplace on July 16, 1981. The question to be resolved is whether he was misled by OSHA into giving up this basic procedural safeguard in warrant cases. The answer turns on the testimony of Ms. Twyford.

The testimony of Ms. Twyford is both unequivocal and unrebutted. I observed her at the hearing and find her entirely credible. She recalled clearly the Area Director's agreement that there would be no first instance penalty. The testimony is entirely consistent with Mr. Bowman's account of why he changed his mind and allowed the compliance officer to inspect. I find as fact that the Area Director misled the Respondent into waiving his right to refuse entry. Mr. Bowman did not

voluntarily consent to the inspection. Consequently, the evidence gleaned from the invalid inspection must be excluded. There is no independent evidence to support the alleged violations being contested by the employer. Therefore they must be vacated.

II

## MERITS OF THE CITATIONS

The undersigned believes that it is also important to address, briefly, the merits of the citations. A review of the record indicates that Respondent should prevail on this alternative basis also. A summary of the relevant evidence and my reasons are set forth below.

## EVIDENCE

The Secretary presented one witness during its case in chief. He called Mr. James E. Rogers, an OSHA Safety Specialist. He has been employed by OSHA since June 1975. He has attended OSHA courses on machine guarding, woodworking, and has inspected several woodworking facilities. He has also been a poultry inspector with the United States Department of Agriculture and was with the United States Navy in the field of electronics (T. 33-34). He has never been employed or worked for a handle factory assembly line. He also testified that he has never operated a bullsaw, trim saw, or equalizer saw (T. 129-130).

Mr. Rogers testified that the bullsaw cited in item 1 of the serious citation did not have an automatically adjusting hood as described by the standard at 29 CFR 1910.213(c)(1). Employees were using the saw to rip lengths of wood that were to be further processed at the bolting saw mentioned in item 1(b) of the citation. The bolting saws also did not have a hood as described by the standard. He observed the operation of the bullsaw during the inspection. The floor was

concrete around the saws and well kept. It was his opinion that there was a hazard of an employee being cut by coming in contact with the exposed blades (T. 37-38; 42; 43; 46; C's Exh 5-8)

Mr. Rogers also testified concerning the table saw used for trimming handle ends cited in item 2 of the serious citation. He indicated that this saw did not have a hood as described in 29 CFR 1910.213(d)(1). It had a guard which consisted of a partial enclosure on the side away from the operator. It did not fully enclose the blade. He observed the saw in operation. It was his opinion that when the end of a handle was being trimmed the employees hand would come within six to eight inches of the saw. The distance would vary depending on the handle's length. It could be 12"-36" during some operations. He felt a hazard existed (T. 50-51).

The compliance officer testified that he observed employees operating gaugers which were cited in item 3 of serious citation number 1. There was a partial enclosure built out of plywood which was pushed up to the back of the machines. It enclosed the back side of the gaugers. The front side was not fully enclosed. He felt the employee was exposed to the knives of the lathe when he first inserted the handle into the device and when he removed the handle from the feed device. He believed there was a hazard involved. Mr. Rogers indicated the hazard was relatively low due to the fact that the employee does not directly feed the material into the knives. He loads the material into the feed device and then pushes the feed device into the lathe knives. He felt the cutting heads could have been more enclosed than they were on the day of inspection (T. 53-54; 58-59).

The Secretary moved to vacate item 3(c) of non-serious citation 2 prior to the compliance officer's testimony. This motion was granted. Mr. Rogers testified that he observed the equalizer saws listed in items 3(a) & 3(b) of the non-serious

citation. They did not have a guard or an enclosure to prevent contact with the point of operation of the blade. The wood saw had an enclosure on the feed side of the blade where the employees fed the stock into the saw. He did not observe the operation of the two equalizer saws. (T. 68-70; C's Exhs. 12-14).

The compliance officer testified that at the time of the inspection he told Mr. Lynn Bowman that he went strictly by the book. At the hearing he indicated the intent of the standard was to protect the operator from coming into contact with the saw blade. The hood would not have to be self-adjusting as stated in the standard cited by the Secretary. Rather it could be a manually adjusted hood. It was his testimony that a compliance officer could pass a piece of equipment that meets the intent of the standard (T. 101-103; 130).

Mr. John Fulcher elected party status. He is the elected representative of Respondent's employees. They desired that he speak for them at the proceeding. He entered the case to advance the position of his employer Bowman Handles, Inc. (T. 25-27). He testified that he has been employed by Bowman Handles for ten years. He has operated the sanding belts, gauging machines, trimsaws and the bullsaws. He has made recommendations concerning safety hazards at the mill over the years. The company has always made adjustments whenever possible (T. 163-164).

Mr. Fulcher explained the history of the company. Ten years ago they had an old mill building that was in terrible shape. It was enclosed on one side. The floor was not concrete. Mr. Bowman took over in 1975. He has poured money back into the business. They now have several forklifts to operate. There is a modern new mill building that has doubled the length of the old one. The floors are concrete rather than dirt. It is insulated and has a heater. The building is closed for comfort. There is a new building which is modern and comfortable where the

handles are prepared for shipping in boxes. A shed has been built for unloading out of the weather. A new air duct has been installed to remove the dust and chips (T. 165-168).

Mr. Fulcher injured his hand while operating a table saw in April 1976. The injury was not due to the fact the saw was unguarded. It happened when he trimmed a handle and ran the saw completely through the wood. At this point of the operation there is no guard which can protect an employee (T. 168-169).

Mr. Fulcher also testified concerning the table saw listed in item number 2. He indicated the operator's hand should never be closer than 10"-12" to the blade because of the operation involved. He warns employees daily about safe operation of the table saw (T. 174; R's Exh. 9).

On December 23, 1981, Mr. Fulcher circulated a petition to Bowman Handles employees. It provided that the employees did not consider their employment to be hazardous and that they felt it was impossible to equip the machines with the guards recommended by OSHA. The employees indicated that they operated the machines and did not consider them hazardous. Nineteen employees between the ages of 19 and 58 signed the petition. These employees are presently working at the mill but were not at the hearing (T. 184; 186; R's Exh. 10). The petition was addressed to Congressman Bill Alexander. Mr. Fulcher indicated that he would not work at any place where he felt his life was in danger due to the employer not maintaining proper guards. He does not consider the saws to be hazardous at the mill. They are guarded as much as possible considering the actual operations conducted in manufacturing handles. He considers the saws to be safe (T. 195-196).

Mr. Orie Candler appeared and testified on behalf of the Respondent. He's worked for Bowman Handles a little over 15 years. He has never felt he was

running a hazardous machine. No pressure was ever put on him to come to the hearing or sign a petition. He has seen significant improvement in safety at the mill since Mr. Bowman purchased it in 1975. This includes the installation of machine guards and the purchase of new machines. The men have always been able to get safety requests complied with from Mr. Bowman. During the past five years a substantial amount of income has gone back into the business (T. 242-244).

Mr. David Candler appeared and testified. He's worked for Bowman Handles off and on for about 16 years. He has been back for the past year. He has noticed a lost of new improvements including the purchase of two automatic sanders. He believes the old sanders are well protected and that you could not get hurt on them. He stated the mill has had as much attention with respect to safeguarding as any of the other plants where he has worked (T. 246-249).

Mr. Eldon Bowman also appeared and testified. He has worked at Bowman Handles for six years. He has been in various handle factories and never seen a saw in any plant more safely guarded than their machines. He has operated every machine at the mill and he does not consider any of the machines to constitute a hazard. He testified that the gauger machine is guarded from the floor up over the gauger. He cannot envision any better guards on the saws (T. 251-256).

Mr. Lynn Bowman also testified. He indicated that he has spent money guarding machines to a point where he considers them safe. He gave the accident history of the company. In 1975 Bowman Handles had 0 accidents and 31 employees; 1976 1 accident and 17 employees; 1977 - 2 accidents and 33 employees; 1978 - 0 accidents and 42 employees; 1979 - 2 accidents and 44 employees; 1980 - 0 accidents and 68 employees; 1981 - 3 accidents and 81 employees, with one employee being hurt twice. There have been no accidents since 1979 requiring hospitalization.

This record was compiled with a workforce that had no experience in handle manufacturing. They train every man they hire for the job he performs. In the past year he has spent $105,000 in upgrading his machinery, improving working conditions, and building guards on machines. He believes that his safety guards are as good as those suggested by OSHA. He indicated that he has tried to run a safe business. He does not have any present orders from his largest companies because of the pending proceedings. He started out not caring whether he closed up or not. The men started the ball rolling and he went along. He believes they are still fighting this case harder than he (T. 263, 334-337).

The Secretary called as a rebuttal witness, Mr. Lawrence Albert Weaver III of Raleigh, North Carolina. Mr. Weaver is a safety engineer and operates a safety and health consulting firm. He has an undergraduate degree from Western Carolina University in experimental and physiological psychology. He has a master of science degree from North Carolina State. Mr. Weaver is a member of the ANSI Committee on woodworking and has done consulting work for members of the woodworking industry. Mr. Weaver has not actually worked in the industry or operated a bullsaw. He also testified that he could not saw handles at the Respondent's mill without training. He has designed guards for the industry but has never designed one for a machine used exclusively in making striking tool handles (T. 272-275; 289; 296-297).

Mr. Weaver was present at the hearing during the testimony concerning the factual circumstances surrounding the operation and guarding of the machines. He also reviewed the Secretary's exhibits 5-14 prior to the hearing. He reviewed each of the items of the citation and concluded that the machines were not guarded in accordance with the applicable OSHA standards. He also testified that the

machines were not guarded in accordance with the state of the art in the woodworking industry today. Mr. Weaver conceded that it is not practical or feasible to put a hood guard over a bullsaw. He indicated that deviations from the standards are acceptable. He also described guards for the machine which would comply with OSHA standards in his opinion. He felt that all the machines in the Secretary's exhibits could be guarded beyond the extent to which they are guarded in the pictures (T. 275-277; 280; 288).

## OPINION

The Secretary's compliance officer and expert witness conceded at the hearing the requirements of 29 CFR 1910.213(c)(1) and 1910.213(d)(1) could not be met by the woodworking industry. However, these witnesses testified the machines were in violation because in their opinion, they were not guarded in accordance with the "state of the art". Respondent contends the machines are adequately guarded considering their operation in manufacturing handles. The evidence on whether a hazardous guarding situation exists is conflicting. It consists of the opinions of Mr. Rogers and Mr. Weaver for the Secretary and the opinions of Mr. Lynn Bowman, Mr. John Fulcher, Mr. Eldon Bowman and several employees for the Respondent. It is well established that opinion testimony, even expert, need not be accepted even if it is uncontradicted. Indeed such testimony is not conclusive and it is up to the trier of fact to determine what weight, if any, will be given to the testimony. Connecticut Natural Gas Corporation, 78 OSAHRC 60/B3, 3 BNA OSHC 1796, 1978 CCH OSHD ¶ 22,874 (No. 13,946, 1978).

The undersigned has reviewed the testimony of the witnesses concerning the need for further guards on the saws at Bowman Handles. I believe that more weight must be accorded the opinions of the Respondent's witnesses Mr. Lynn

Bowman, Mr. John Fulcher, Mr. Orie Candler, Mr. David Candler, and Mr. Eldon Bowman. My reasons follow.

All witnesses in this case were forthright and candid. The parties clearly have a difference of opinion on the ultimate issue of whether the machines are guarded in accordance with the state of the art. This question is necessarily a matter of opinion. I conclude that Respondent's witnesses are more qualified to determine the state of the art in the handle manufacturing industry. The question is not one addressed to the woodworking industry as a whole. Rather it must be confined to the Respondent's saws which are used to manufacture a specific product, i.e. handles. Mr. Bowman and his employees have hands on experience in every phase of the operation. They have extensive experience with these machines. The Secretary's witnesses have good general experience. Mr. Weaver has experience in general woodworking problems. However I credit the opinions of Messrs Bowman, Fulcher, and the employees based on their personal knowledge and experience set forth above.

I have also been impressed by the genuine outpouring of support on behalf of Mr. Lynn Bowman. He is highly regarded as a safety conscious employer. The record supports the confidence his employees place in him. He has completely renovated the mill since 1975. In addition he has spent $105,000 in 1981 upgrading his machinery, improving working conditions and building guards on machines. He has a good safety record. For the above reasons I conclude that the Respondent's saws cited in items 1, 2, and 3 of the serious citation and item 3 of the non-serious citation are guarded in accordance with the state of the art. Consequently these items must also be vacated on this alternative basis.

## FINDINGS OF FACT

1. On January 29, 1981, OSHA attempted a general schedule inspection of Respondent's workplace. OSHA was refused entry.

2. A second attempt was made on Febraury 24, 1981, and Respondent again refused entry.

3. OSHA received a letter of complaint on June 16, 1981, from an employee of Bowman Handles, Inc. at the Little Rock, Arkansas Area Office.

4. An OSHA employee complaint form filled out by the same employee was received on June 23, 1981, by the Little Rock Area Office.

5. Thereafter .e Secretary applied for an inspection warrant indicating that Bowman Handles was scheduled for a programmed safety inspection pursuant to a scheduling system based on objective selection criteria.

6. A United States Magistrate issued an inspection warrant on July 7, 1981.

7. Respondent was served with the inspection warrant on July 8, 1981, and refused OSHA entry to the mill.

8. The Little Rock Area Director agreed to inspect Bowman Handles on a no penalty inspection basis if the employer would allow OSHA in the mill.

9. Bowman Handles allowed OSHA to inspect the mill on July 16, 1981, based on the statement of the Little Rock Area Director that it would be a no penalty inspection.

10. The inspection resulted in the subject citations and proposed penalties being issued to Bowman Handles, Inc.

11. The Little Rock Area Director misled the Respondent into waiving his right to refuse entry.

12. Respondent's saws are guarded in accordance with the state of the art as it exists today with respect to the manufacturing of handles.

## CONCLUSIONS OF LAW

1. Respondent, Bowman Handles, Inc. is engaged in a business affecting commerce and has employees within the meaning of Section 3(5) of the Act. The Commission has jurisdiction of the parties and of the subject matter of these proceedings.

2. On July 16, 1981, Respondent was not in serious violation of 29 CFR 1910.213(c)(1), 1910,213(d)(1); 1910.213(o)(2); 1910.215(a)(1); and was not in violation of 1910.213(r)(4) of the non-serious citation.

## ORDER

On the basis of the foregoing Findings of Fact and Conclusions of Law it is ORDERED that:

1. Items 1(a) bullsaw; 1(b) bolting saws; (2) table saw; 3(a) & (b) gaugers; (4) abrasive wheel; of serious citation number 1 and the proposed penalties of $1,120 for items 1-5 are VACATED.

2. Items 3(a)(b) & (c) of non-serious citation number 2 which proposed no penalty are VACATED.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>BOWMAN HANDLES, INC.,<br><br>Respondent. | OSHRC DOCKET NO. 81-2102 |

ORDER

SCHWARTZ, Judge:

The parties have been contacted concerning the setting of a hearing in this matter. They have agreed to a hearing on January 5, 1982, in Batesville, Arkansas. The hearing will commence at 10:00 a.m. in Room 206, of the United States Post Office and Federal Building, East Main & South 4th Street.

The case file indicates that a number of employees have expressed interest in this matter. These employees are David Candler, Eldon Bowman, Alvin L. Light, Orie Candler, Mike Fulcher, and John L. Fulcher. It appears these employees desire to participate as witnesses on behalf of the Respondent. A copy of this order is being sent to them. They should appear at 10:00 a.m. on January 5, 1982. Prior to the hearing I shall determine what status they desire and rule upon their individual requests.

One final point must be resolved. Complainant has filed a request for entry into Respondent's workplace. Complainant requests Respondent to permit

APPENDIX "A"

the entry of Robert J. Block, PHD, P.E. of Norman, Oklahoma and Albert Weaver, MSIE, CSP, of Raleigh, North Carolina, for the purpose of inspection and measuring, surveying, photographing, testing, and sampling from day to day until such inspection has been completed. Complainant desires to determine what engineering controls exist for Respondent to achieve compliance with the woodworking machinery guarding requirements of 29 CFR 1910.213. The specific machinery to be inspected corresponds with the equipment cited in the citations being contested.

Respondent has objected to Complainant's request. The objection is contained in a letter dated November 25, 1981, which has been treated as an answer by the Commission. The relevant documents are attached hereto since the undersigned Judge is not certain the Complainant has a copy of Respondent's letter of November 25, 1981.

There is no question that discovery inspections are ordinarily permissible where a violation of the noise standard is involved. Ralston Purina Company, 79 OSAHRC 81/E6, 7 BNA OSHC 1730, 1979 CCH OSHD ¶23,897 (No. 78-145, 1979). Where, as here, the case does not involve noise the Commission has set forth criteria to be followed by the trial Judge. Ralston Purina Company, supra, teaches that the decision whether to allow discovery is within the Judge's sound discretion. This sound discretion should be guided by the objective of providing a fair and prompt hearing to the parties. Moreover, the Judge is instructed to consider the need of the moving party for the information sought, any undue burden to the party from whom discovery is sought, and on balance, any undue delay in the proceeding that may occur.

I will now apply these criteria to the instant case. Chief Judge Tenney noted in his letter to Congressman Alexander that the Commission is sensitive

to the fact Respondent is a small business and is appearing without counsel. Judge Tenney noted the Respondent would receive a prompt hearing. I agree.

Complainant's need for the information has also been considered. I have had a number of saw-guarding cases. This is the first case where Complainant has sought reentry to determine what engineering controls exist to achieve compliance with the saw-guarding regulations. These cases are routinely tried without resort to Rule 34 motions for entry upon land. The Secretary, unlike a noise case, does not have an increased burden of proving the feasibility of engineering controls under the saw-guarding regulations.

Finally I have considered the question of undue burden to the Respondent. He operates a small business. The Complainant made an initial inspection and issued the subject citations. Respondent contests to the Commission. Complainant now seeks to conduct a day to day inspection of Respondent's workplace until its experts have made their findings. The second inspection could only upset Respondent's routine and burden him in his effort to conduct business. The employees would be observed by two new individuals while doing their work. This undue burden outweighs any need, real or imaginery, by the Secretary to conduct a second inspection as set forth above. Consequently, I conclude the Complainant's request to enter the workplace must be denied.

# NOTICE OF DECISION

Secretary of Labor v. Murphey Well Service, Inc.
OSHRC Docket NO. 80-2983

1. Enclosed is a copy of my decision. It will be filed with the Commission on February 4, 1982, and will become the final order of the Commission on March 8, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D. C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is March 8, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed portcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92 and 93.

|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>MURPHEY WELL SERVICE, INC.,<br><br>Respondent. | OSHRC DOCKET NO. 80-2983 |

DECISION AND ORDER

Appearances:

Thomas M. Tompkins, Esq., of Dallas, Texas for the Complainant.

Ronnie Murphey, of Alice, Texas, for the Respondent.

BOTKIN, Judge:

This is a proceeding brought before the Occupational Safety and Health Review Commission ("the Commission") pursuant to §10 of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651 et seq. ("the Act"), contesting the penalty portions of a citation issued by the complainant, the Secretary of Labor ("the Secretary"), to the respondent, Murphey Well Service, Inc. ("Murphey, Inc."), under authority vested in the Secretary by §9(a) of the Act.

As a result of an inspection conducted on April 22, 1980, of a workplace located at Hughes & Hughes Schulze No. 2 Well, Driscoll, Texas, two citations were issued to respondent on May 1, 1980, alleging violations of §5(a)(1) and §5(a)(2) of the Act. The citations charged the respondent with four serious and four nonserious violations. On May 9, 1980, both citations were amended.

As pertinent hereto, item 4 of citation no. 1 was deleted. Respondent timely filed a notice of contest on May 20, 1980, thus commencing this proceeding before the Commission under §10(c) of the Act. In said notice of contest and at other subsequent times, respondent made clear that it was contesting only the amount of penalties to be assessed by virtue of serious violations related to items 1, 2 and 3 of citation no. 1 (notice of contest dated May 20, 1980, letter dated September 24, 1980, Tr. 4, 5). A hearing was conducted in Corpus Christi, Texas on November 14, 1980. No affected employees or representatives of affected employees participated in the proceeding. The matter is now ripe for decision.

## ISSUES

1. The amount of the civil penalty to be assessed for serious violations of §5(a)(1), (items 1 and 2 of the citation), and §5(a)(2), (item 3 of the citation), of the Act.

## JURISDICTION

At the commencement of the hearing, an inquiry was made by the undersigned whether the parties had arrived at any stipulation of facts, including those related to jurisdiction (Tr. 4). Respondent stated that the only matter contraverted was the propriety of the proposed penalties (Tr. 4-5). Counsel for the Secretary stated that it was his understanding that an issue did not exist regarding jurisdiction (Tr. 8). The record in this case discloses that respondent did not suggest otherwise. Based thereon, I find that whether the Commission has jurisdiction of the parties and the subject matter of this proceeding is not at issue in this case.

Nevertheless, the record does establish that (i) respondent is engaged in the business of servicing (working over) oil and gas wells, (ii) the operations of workover and drilling rigs are similar, and (iii) there are approximately 4,000 to 4,500 rigs (rotary, drilling and workover) currently working in the United States on a daily basis (respondent's letter dated September 24, 1980, Tr. 12-13; Tr. 48; Tr. 72). Obviously, such work is one part of the total process involved in the production of oil and gas. It is well established that, by use of the phrase "affecting commerce" in §3(5) of the Act, Congress intended to exercise the full reach of its power under the commerce clause. Avalotis Painting Co., 9 BNA OSHC 1226, 1981 CCH OSHD ¶25,157(No. 76-4774, 1981). In cases where the statute requires only that the particular business "affects commerce," statutory jurisdiction exists if the business is in a class of activity that as a whole affects commerce. Usery v. Franklin R. Lacy, 628 F.2d 1226 (9th Cir. 1980). I find that it is patently clear that, in the aggregate, this type of business activity affects commerce. Therefore, its activities fall within the class of activities that Congress intended to regulate. Respondent is an employer engaging in a business affecting commerce who has employees, within the meaning of §3(5) of the Act.

## EVIDENCE

The evidence in this case consists of testimony by Roger Frazier ("Frazier"), the compliance officer, his worksheets related to the investigation (Exs. C-1 through C-3), and two photographs taken by him at the workplace (Exs. C-4 and C-5).

## PARTIAL RESOLUTION OF THE FACTS

Frazier's background as a compliance officer in safety matters includes over five years with the federal agency and three years with a state agency (Tr. 9-10). He has conducted approximately 470 inspections for OSHA which include nearly 100 inspections related to oil well operations (Tr. 12). The major portion of his work experience, 33 years, was spent as an employee of a major oil company. He commenced that career as a petroleum engineer, spending considerable time around actual drilling operations. In the early 1950's, he entered the operations and supervisory aspect of such work with pertroleum engineers reporting to him (Tr. 10-11). He has been involved in the drilling of between 500-1000 oil wells (Tr. 12).

On April 22, 1980, Frazier conducted an inspection of respondent's rig #2 at its workplace located at the Hughes & Hughes Schulze No. 2 Well, in Driscoll, Texas (Tr. 12, Exs. C-1, C-2 and C-3).

The drilling crew was composed of a four man crew and two tool pushers. A tool pusher is the supervisor of a crew and floorhands are the laborers (Tr. 27). Another person present is the driller who operates the rig. In this instance, a mobile workover rig was being used (Tr. 28, 48). While the operations of a workover rig and drilling rig are similar, the size of equipment on a workover rig is considerably smaller (Tr. 48). While he was there, they were drilling a cement plug. During this process, a fluid, consisting primarily of water with some mud additives, was being circulated through the system (Tr. 28). The dual purpose thereof was to cool the bit and to carry out cuttings as the hole was drilled (Tr. 29).

The rotary hose is a flexible hose extending approximately 30 or 40 feet from the swivel end thereof to its connection at the end of the standpipe, a steel pipe which extends up vertically in the derrick (Tr. 17). In this case the hose was 34 feet long and the distance to the top of the standpipe was 30 feet (Ex. C-1). When the bit is in operation, fluid or mud is pumped up through the standpipe, through the rotary hose, and down through the drilling string to the bit (Tr. 17-18). Pumping is performed at various pressures, depending on what is being drilled and whether there is a restriction in the bit. Usually the pressure is over 500 pounds per square inch ("psi"), unless pumping is being performed very slowly, and it can go as high as 2,000 psi (Tr. 18). In this operation, the pressure was normally between 400-500 psi (Ex. C-2). During this process, the hose vibrates. At times, rotary hoses work loose or simply break off from their connection to the standpipe or swivel (Tr. 18).

The ends of the rotary hose were not secured (end of the hose at the standpipe to the derrick and the swivel end to the swivel) (Ex. C-1). The dimension of the hose was two inches (Tr. 49). 1/ The hose is reinforced with metal wires. It is stiff and quite heavy (Tr. 18, 76). At the swivel, the union is formed between the metal connection at the end of the hose and an iron gooseneck on the swivel (Tr. 71). The compliance officer did not remember the

---

1/ Although the rotary hose was described in Ex. C-1 as having a dimension of 2 3/8 inches, the compliance officer conceded that he had no basis to dispute that, in fact, it was a two inch hose (Ex. C-1, Tr. 49).

rating of the hose and was unaware that it was rated for 2,000 psi (Tr. 49). However, he subsequently adopted Ronnie Murphey's ("Murphey") statement that it was rated at that level (Tr. 59). 2/

A hazard exists that the hose may vibrate off or break off at one of the two connections and fall to the rig floor or surrounding area and strike (i) an employee, or (ii) another object such as a piece of pipe, causing the other object to hit an employee (Tr. 18-19, 71, Ex. C-1). The compliance officer had recently conducted an investigation where such an incident had resulted in a fatality (Tr. 19). In his total experience, he recalled approximately ten times where such incidents occurred in which the metal end on the hose struck a workman (Tr. 72). 3/ Even if the metal end separated from the hose, this would not significantly reduce the hazard of serious physical harm if a worker was struck, due to the weight and stiffness of the hose (Tr. 76-77). I find that the occurrence of such an incident was reasonably foreseeable. I further conclude that the likely result of such an incident would be death or serious physical harm (Tr. 18-19, 20, 76, Ex. C-1). The tool pusher was at the workplace practically all of the time and Murphey, vice president of the respondent, periodically visited that location (Ex. C-1). The violative condition was easily observable by sight if due diligence had been exercised.

---

2/ Moreover, his earlier statement that pressure can go as high as 2,000 psi appears to be an indirect indication of his awareness thereof (Tr. 18).

3/ This modifies or at least defines his statement that such incidents are the cause of a ". . . common injury . . . on rigs . . ." (Tr. 72).

Therefore, the requisite knowledge was present. It is well established that a supervisor's knowledge is imputable to an employer.

There are approximately 4,000 to 4,500 rigs (rotary, drilling and work-over) currently in operation. The average work crew numbers four or five and the rigs are operated approximately 300 days a year (Tr. 72-75).

To prevent the hazard, safety chains are attached near each end of the rotary hose, to the swivel and to the top of the standpipe over the leg of the derrick. The safety chain catches the hose and prevents it from falling (i) if the hose separates (blows, breaks or comes off) at its connection with either the swivel or the standpipe, or (ii) if the metal portion on the end of the hose separates from the hose itself (Tr. 19-20, 75).

Any worker on the rig floor or in the proximity thereof during the pumping operation would be exposed to the hazard. For the most part, those exposed were the floorhands and driller. During the inspection, the tool pusher performed the drilling part of the time (Tr. 23-25, 53). Four workmen were exposed to the hazard on an intermittent basis (Tr. 26). 4/ At many times, there is no exposure to the hazard (Tr. 26). Floorhands are normally on the floor after pumping has ceased and there is no pressure on the hose (Tr. 53-54). However, that is not always true (Tr. 53). 5/ Occasionally, they may be cleaning up after making a connection, washing the floor, repairing a tool or getting a tool (during the

---

4/ While the compliance officer originally stated that three workmen were exposed to the hazard, he apparently increased the number after recalling that the tool pusher also performed part of the drilling (Tr. 23-25, Ex. C-1).

5/ Conceded by Murphey during questioning (Tr. 53).

pumping operation) (Tr. 54). 6/ Moreover, the floorhands do not have to be on the floor to be exposed (Tr. 53). Ordinarily, the hose does not fall straight down, but goes flipping out where it could hit a floorhand on the ground (Tr. 52-53). While at his controls, the driller is in a much safer position on this particular rig (than usual), because the controls are set back of the derrick (Tr. 52). 7/ Exhibit C-4, a photograph taken during the inspection, reveals a floorhand standing on the ground in close proximity to the rig floor where he could be struck by a falling rotary hose (Tr. 65-68, Ex. C-4). Exhibit C-5, another photograph, reveals the operator of the rig at his controls without benefit of a hard hat (Tr. 68, Ex. C-5). 8/ Employee exposure existed two to three hours per day for approximately four or five days (Ex. C-1).

A positive displacement pump, Gardner Denver model PA8Y, which circulated fluid throughout the drilling system, did not have a relief valve on the discharge side of the pump (Tr. 21, 33, 58, Ex. C-2). Approximately three weeks earlier the safety valve had popped out and respondent had a new one on order (Ex. C-2). The pump forces the mud or fluid from the pump (i)

---

6/ Conceded by Murphey during questioning (Tr. 54).

7/ The exact distance was not measured by the compliance officer (Tr. 51-52).

8/ I agree with respondent that this picture does not depict the true horizontal distance between the driller and the rotary hose (Tr. 68-69). Both pictures appear to be taken at angles that offer little assistance on the distance between the driller and the rotary hose (Exs. C-4 and C-5).

through the surface line, (ii) over to the rig (iii) up through the standpipe, (iv) through the rotary hose, and (v) down the drill string to the bottom of the well, where it is returned back up on the outside (Tr. 21, 33). All of the lines are steel except the rotary hose (Tr. 33-34). The action of the pistons raise the pressure by pumping fluid (Tr. 21). The pump was located approximately 30 to 50 feet from the well (Tr. 23). All lines (steel) and the pump had been tested for a capacity up to 10,000 psi (Tr. 32-33, Ex. C-2). The pump was usually operated at 400-500 psi and the relief valve was normally set at 1,000-1,500 psi for this operation (Ex. C-2). The pump did have a pressure gauge which was operational (Tr. 54).

Occasionally, the bit at the bottom of the well plugs up with debris. When that occurs or if a valve on the line is closed, pressure builds up throughout the system (Tr. 21-22). If a motor has adequate horsepower and something (the bit) plugs, the pressure will rise until some part of the system blows up (Tr. 56). The weakest portion of the system will be the first to give way (Tr. 59). The pump and connections on the lines may become fatigued and develop weak spots over a period of time due to vibration or pulsation (Tr. 34, 60). However, I find that, since the pump and all lines (steel) had a test capacity up to 10,000 psi, the weakest point in this system was the rotary hose which was rated for 2,000 psi (the psi of the hose was previously found to be at said level hereinabove).9/

---

9/ A holding that there might be weaker points in the system due to fatigue would be rank speculation. Therefore, testimony and inspection notes related to ruptured pieces of metal (pump or steel lines) is simply irrelevant.

If excessive pressure did build up, a worker on the floor of the rig or in the vicinity thereof would be exposed to the hazard of being struck by the rotary hose or a high pressure leak from the rotary hose (Tr. 22, 33, 35, 53, 60). 10/ The force of fluid under high pressure can blow or blast a person, who is struck by it, into surrounding objects (Tr. 22-23, Exs. C-4 and C-5). Therefore, all of the facts heretofore set forth in regard to unsecured ends of the rotary hose (item 1), as they relate to (i) identity and number of workmen exposed to the hazard, (ii) the length of time of such exposure, (iii) such an incident being reasonably foreseeable, and (iv) the likely result of such an incident being death or serious physical harm, are hereby incorporated by reference. The tool pusher had actual knowledge of the missing relief valve, as a replacement had been ordered (Ex. C-2). His knowledge is imputed to respondent. In general, it was agreed that the hazard in this case was lessened when the operator of the motor was at his controls watching the pressure gauge (Tr. 58-59). During the inspection, there was an operator at the pump most of the time (Tr. 23, 55-56). The determining factor in regard to the rapidity of a build up in the level of pressure is whether the bit plugs up slowly or quickly (Tr. 57). The operator at the pump could shut it down if he happened to be right there and saw a rise in pressure quickly enough (Tr. 56).

---

10/ Initially, the compliance officer had stated that the workman at the pump would be the worker most likely to be hurt and exposure to a threat of serious physical harm to anyone else was slight. However, after questioning by the respondent about various safety factors at the pump and the weakest area of the system (rotary hose), his testimony changed (Tr. 35-36, 54-55, 56-60).

To prevent the hazard, a relief valve is set on the pump within the allowable working pressure of the weakest component in the circulating system (Tr. 22, 34). As heretofore stated, there was no relief valve on this pump (Tr. 58, Ex. C-2).

A fixed ladder extends up the derrick to the tubing racking board, which is the area in which the derrickman works, and then extends up to the crown block (Tr. 36). Workers also go to the crown block of the derrick which is approximately 95 feet high (Tr. 39, 40, Ex. C-3). The tubing racking board is approximately 58 feet high (Tr. 36, 40, Ex. C-3). Although the ladder extends to the crown, it is primarily used for access to the tubing racking board (Tr. 36, 66-67, Ex. C-4). During the time the rig had been at this workplace, the ladder had been used a total of five days. It was used for two round trips on each of those days. Only two of said trips were made to the crown (Tr. 39, 40, Ex. C-3).

There was no ladder climbing device or safety device to prevent a fall (Tr. 36, Ex. C-3). Consequently, workmen who used the ladder were exposed to the hazard of falls of up to 58 feet or 95 feet (approximate distances), depending upon their destination, down to the floor of the rig where there is machinery and jagged parts (Tr. 40). There was a substantial probability that death or serious physical injury could result from respondent's failure to protect its employees from such falls (Tr. 40, Ex. C-3). The presence of respondent's supervisory officials at the workplace has been previously noted (Ex. C-3). They knew, or with the exercise of reasonable diligence, could have known of the hazard of falls from the fixed ladder. Said knowledge is imputed to respondent.

There are several kinds of safety devices used to prevent such falls. A worker wears a climbing belt to use any of the devices. One commonly used is a counterweight device. A safety line (wire line) is attached to the climbing belt. It extends up to the top of the derrick and then descends to the ground, at an approximate 45 degree angle, where it is secured to a stake in the ground. Weights, of an amount sufficient to counteract the weight of the workman, are placed in a box mounted on wheels. This counterweight rides up and down the wire line at said 45 degree angle (Tr. 36-38). Other devices include (i) one where the climbing belt is attached to a small trolley that runs on a safety line (wire line) which runs from the top to the bottom of the ladder, and (ii) another where the safety line is attached to the climbing belt and a device with pulleys therein. Said devices permit the worker to move slowly up or down. However, sudden moves, slight jolts or jerking movements cause the device to grab and lock onto the safety line; thereby catching the worker to stop a fall (Tr. 61-62).

## DISCUSSION AND OPINION

Item 1 of serious citation 1 charged respondent with a failure to secure the ends of the rotary hose to the derrick or mast and to the swivel to prevent the hose from falling and causing death or serious physical harm to employees in contravention of §5(a)(1) of the Act.11/ Item 2 of that citation also

---

11/ Section 5(a)(1) provides that:

> Sec. 5.(a) Each employer--
>
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees; . . .

charged a violation of §5(a)(1) of the Act. It involved respondent's failure to provide a relief valve on the discharge side of a positive displacement mud circulating pump to protect employees from hazards caused by excessive pressures resulting from plugging or unforeseen problems. Item 3 of the same citation charged respondent with a failure to provide a safe climbing device on a derrick ladder to protect employees from falls when going to and from the tubing racking board (up to approximately 58 feet) or the crown block (up to approximately 95 feet), contrary to 29 CFR 1910.27(d)(5).12/

As heretofore noted, the only aspect of the citation contraverted by respondent involved the propriety of the proposed penalties. At the hearing, Murphey stated that he did not totally understand the difference between serious and nonserious violations (Tr. 5). Although he questioned whether any employee was in danger or the company's knowledge of the situation, he reiterated that he did not want to contest their classification as serious (Tr. 6).

---

12/ The cited standard provides:

(5) LADDER SAFETY DEVICES. Ladder safety devices may be used on tower, water tank, and chimney ladders over 20 feet in unbroken length in lieu of cage protection. No landing platform is required in these cases. All ladder safety devices such as those that incorporate lifebelts, friction brakes, and sliding attachments shall meet the design requirements of the ladders which they serve.

The definition of a serious violation is contained in §17(k) of the Act.13/ The Act does not contain a definition of a nonserious violation.14/ For a violation to be serious within the meaning of §17(k) of the Act, the record must establish that there is a substantial probability that death or serious physical harm could result if an accident occurred. The probability of the accident occurring is irrelevant, Niagara Mohawk Power Corp., 79 OSAHRC 36/A2, 7 BNA OSHC 1447, 1450, 1979 CCH OSHD ¶23,670 (No. 76-2414, 1979). The record must also establish that the employer knew, or with the exercise of reasonable diligence, could have known of the violation.15/ Based on the facts related thereto which are set forth under the section entitled PARTIAL RESOLUTION OF THE FACTS, I find that the above criteria is met and that serious violations of items 1, 2 and 3 of the citation were established.

---

13/ Section 17(k) provides:

> (k) For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

14/ However, the Commission has held that such violations bear a direct and immediate relationship to employee safety and health, but not such a relationship that a resulting injury or illness would likely cause death or serious physical harm. Crescent Wharf and Warehouse Co., 2 OSAHRC 1318, 1 BNA OSHC 1219, 1971-73 CCH OSHD ¶15,687(No. 1, 1973).

15/ The Secretary has the burden of proving employer knowledge for both serious and nonserious violations of the Act. Prestressed Systems, Inc., 81 OSAHRC 43/D5, 9 BNA OSHC 1864, 1981 CCH OSHD ¶25,358 (No. 16147, 1981).

§17(j) of the Act requires the Commission, in assessing penalties, to consider the gravity of the violation and the employer's size, good faith and history of previous violations. These factors need not be accorded equal weight, but the gravity is usually of greater significance than the others. Colonial Craft Reproductions, 72 OSAHRC 11/B10, 1 BNA OSHC 1063, 1971-73 CCH OSHD ¶15,277 (No. 881, 1972). Elements to be considered in determining gravity include the number of employees exposed to the risk of injury, duration of the exposure, precautions against injury, and the degree of probability of occurrence of an injury. National Realty & Construction Co., Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶15,188 (No. 85, 1972), rev'd on other grounds, 489 F.2d 1257 (D.C. Cir., 1973).

Under these criteria, the gravity of each of the three violations is rather low. The number of employees exposed to the risk of injury was quite small. Furthermore, the frequency and length of time of such exposure was very limited. In regard to item 2, respondent had attempted to preclude an excessive build up of pressure in the circulating system by placing a pressure gauge on the pump where an operator could watch it. However, the operator was not always at that station. Moreover, his attention could be temporarily diverted elsewhere while at the pump. The probability that an incident or accident would occur is relatively low for each of the violations. Murphey, Inc.

is a small employer.16/ Moreover, the evidence does not establish a history of prior violations (Tr. 45-46). Finally, respondent must be graded high on the good faith aspects of this case. Without hesitation, all items in both citations were corrected. In fact, additional items not cited were corrected, together with all similar items on respondent's other rig (letters dated May 20, 1980 and September 24, 1980). While Murphey did not take the witness stand, his demeanor as the representative of the respondent in the hearing was impressive.

The penalties recommended by complainant have been fully considered. However, the Commission is not bound to follow complainant's recommendations. Nacirema Operating Co., 1 OSAHRC 33, 1 BNA OSHC 1001, 1971-73 CCH OSHD ¶15,032 (1972). Based on the foregoing, the appropriate penalties are found to be as follows: item 1, $25.00; item 2, $25.00; and item 3, $50.00.

## FINDINGS OF FACT

The evidence of record having been considered and evaluated in its entirety, the following facts are specifically found:

1. To avoid repetition, those facts set forth under the headings entitled JURISDICTION and PARTIAL RESOLUTION OF THE FACTS are hereby incorporated by reference to the extent that they are not set forth hereunder.

---

16/ The compliance officer obviously was not certain as to the exact number of employees (Tr. 46-47). Murphey had earlier stated that the firm had ten employees. He might not have counted corporate officers as employees (letter dated September 24, 1980). At any rate, respondent is a small employer.

2. If an accident occurred as a result of respondent's (i) failure to secure the ends of the rotary hose, (ii) failure to provide a relief valve on the mud circulating pump, or (iii) failure to provide a safe climbing device on the derrick ladder, there was a substantial probability (in each instance) that death or serious physical harm could result therefrom.

3. Respondent's supervisory officials knew or, with the exercise of reasonable diligence, could have known of the violative conditions created by the work conditions described in finding of fact no. 2 hereof.

4. Respondent was in serious violation of §5(a)(1) of the Act (items 1 and 2 of citation 1) and 29 CFR 1910.27(d)(5) (item 3 of citation 1).

5. The gravity of each of the violations was rather low.

6. Respondent is a small employer.

7. There is no history of prior violations.

8. The evidence establishes good faith on the part of the respondent.

9. The appropriate penalties are (i) $25.00, item 1, (ii) $25.00, item 2, and (iii) $50.00, item 3.

## CONCLUSIONS OF LAW

1. At all times material hereto, respondent was an employer within the meaning of the Act, engaged in a business affecting commerce, and having employees.

2. The Commission has jurisdiction over the parties and the subject matter of the proceeding.

3. Respondent was in serious violation of §5(a)(1) of the Act (item 1 of citation 1).

4. Respondent was in serious violation of §5(a)(1) of the Act (item 2 of citation 1).

5. Respondent was in serious violation of 29 CFR 1910.27(d)(5) (item 3 of citation 1).

## ORDER

Upon the basis of the foregoing findings of fact, conclusions of law, and the record as a whole, it is ORDERED that:

1. Item 1 of citation 1, alleging a serious violation of §5(a)(1) of the Act, is AFFIRMED, and a civil penalty of $25.00 is ASSESSED.

2. Item 2 of citation 1, alleging a serious violation of §5(a)(1) of the Act, is AFFIRMED, and a civil penalty of $25.00 is ASSESSED.

3. Item 3 of citation 1, alleging a serious violation of 29 CFR 1910.27(d)(5), is AFFIRMED, and a civil penalty of $50.00 is ASSESSED.

## NOTICE OF DECISION

Secretary of Labor v. FANTONI COMPANY, INC.
OSHRC Docket No. 80-6680

1. Enclosed is a copy of my decision. It will be filed with the Commission on February 8, 1982, and will become the final order of the Commission on March 10, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is March 10, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Appearances: For Complainant,

Albert H. Ross, Regional Solicitor
U. S. Department of Labor
JFK Federal Bldg., Room 1803
Boston, Massachusetts 02203
Attn: David Snyder, Esq.

For Respondent,

Robert Calagione, Esq.
294 Washington Street, Suite 340
Boston, Massachusetts 02108

STATEMENT OF PROCEEDINGS:

A hearing was held in Boston on June 1, 1981, regarding Serious Citation No. 1 which was issued on October 8, 1980, with a proposed penalty of $420.00.

The regulation in issue at 29 CFR 1926.550(a)(15)(i) states:

> "Except where electrical distribution and transmission lines have been de-energized and visibly grounded at point of work, or where insulating barriers, not a part of or an attachment to the equipment or machinery, have been erected to prevent physical contact with the lines, equipment or machines shall be operated proximate to power lines only in accordance with the following: ...the lines rated 50 kv. or below, minimum clearance between the lines and any part of the crane shall be 10 feet."

The Secretary alleges that the Respondent violated that regulation on September 18, 1980, while operating an Insley H-300 backhoe in Waltham, Massachusetts, on Exchange Street next to the 195 School Street area.

EVIDENCE

Mr. Alexander Steel, Jr., a compliance officer for the Occupational Safety and Health Administration specializing in construction inspections (Tr. 14-15) testified that he inspected the Respondent's two worksites on Lexington Street in Waltham as well as the one in issue on Exchange Street (Tr. 17-18). At the latter location, he observed a trench in the street, a backhoe and some trucks. (Tr. 18) He stated that the backhoe was situated in approximately the middle of the street with its cab under the high-tension wire, and about five employees were working on the project, including the backhoe operator who was seated inside the cab of the machine. (Tr. 19) The witness noted electrical lines crossing Exchange Street (Tr. 20) consisting of three transmission lines on the cross bar plus one 110-240 electric line. (Tr. 21-22) When Mr. Steel arrived at the site, he observed the backhoe scraping the end wall of the trench with the bucket, and he opined that there was a hazard of electrical shock to two employees due to the backhoe operating about six feet from the high-power lines. (Tr. 23-25, 42) The part of the backhoe in close proximity to the wires was where the boom and arm meet (Tr. 25) (see Exhibit C-1 with identifying marks). No precautions were taken to prevent contact with the energized line. (Tr. 42)

According to the witness, he testified that one of Respondent's employees, Mr. LaBonne, stated that the three lines were alive, thus leading to Mr. Steel's informing the backhoe operator of said situation. (Tr. 26) The operator then

turned off the machine and climbed down, indicating he wouldn't resume until the lines were de-energized. (Tr. 26) Mr. LaBonne then called Boston Edison to shut the line down, and Mr. Steel testified that he observed an employee of the electric company go up in a bucket to de-energize the lines. (Tr. 27-28, 32) (Exhibit C-6)

On cross examination, Mr. Steel indicatd that he saw the backhoe scraping the back wall of the trench about 3 feet in the ground, but did not observe it dumping materials into the truck, and he only approximated the distance between the boom and the transmission lines. (Tr. 44-47, 64) (See exhibit C-4) He estimated that the lines were 28 feet high (Tr. 58) and the boom was 18-20 feet high (Tr. 51-52)

He testified that Mr. LaBonne, an employee of the Respondent and Mr. Gross of Boston Edison Company both indicated to him that the lines in issue were still energized (Tr. 59)

Mr. Richard LaBonne, a superintendent of the Respondent (Tr. 70) testified that he had contacted both Boston Edison Company and New England Telephone Company about one month prior to the inspection. (Tr. 71-72) He stated that an employee of the electric company indicated that two of the trhee lines through the transformer could be de-energized so the witness requested it be the two inside lines, one of which he called the hazard line. (Tr. 72-74, 84) He knew that the third line would remain alive but he believed that two had already been de-energized at the time Mr. Steel inspected the site. (Tr. 74, 77-78)

## DISCUSSION

No defense has been raised asserting that a backhoe was not the type of equipment covered by the requirements of the pertinent regulation; therefore, it is not an issue. Compare, Tri-City Construction Company 1980 CCH OSHD 24,557.

In the Complainant's Request for Admissions, Respondent's answer to number 11 admitted that each electrical line carried 2,400 volts and the testimony indicated that no barriers had been erected to prevent physical contact with the power lines.

As to the issue of whether or not the backhoe came within 10 feet of an energized electrical line while scraping the end of the trench wall, the evidence included the compliance officer's testimony that only approximated the electrical lines to be 28' high, and the backhoe's arm and bucket to be 18-20' high when extended upward. The witness did not take measurements. There was some confusion as to the exact location of the backhoe relative to the sidewalk and as to which of the lines were energized at the time of the inspection. Mr. Steel could not state with any consistent certainty which line or lines were being de-energized while he observed the Boston Edison employees at work. The Respondent's late defense and response to the Complainant's Request for Admission concerning the energized lines is viewed as weighing heavily against its credibility on this issue; however, the burden of proof is on the Complainant to show by the preponderance of the evidence that the measurements were within the distance considered to be in violation of the regulation.

Assuming arguendo that all the lines were energized or in the alternative that only the hazard line remained energized, the Complainant's only testimony on distances consisted of approximations, which by the witness' own account included a two-foot leeway on the length of the backhoe's arm. With distance being of the utmost importance in this case, it is imperative that more certainty on that issue be established than was presented here; thus, the citation must be vacated.

## FINDINGS OF FACT

1. Compliance officer Alexander Steel made a duly authorized and proper inspection of the Respondent on September 18, 1980, at its work site in Waltham, Massachusetts.

2. The Respondent is found to have been engaged in trench excavation at the time of the inspection.

3. The Respondent is found to have contested Serious citation 1 with its proposed penalty of $420.00.

## CONCLUSIONS OF LAW

1. At all times relevant herein, the Respondent has been engaged in a business affecting commerce within the meaning of Section 3 of the Occupational Safety and Health Act of 1970.

2. Respondent was, at all times relevant hereto, subject to the requirements of the Occupational Safety and Health Act and the standards promulgated.

3. The Commission, at all times relevant hereto, has had jurisdiction of the parties and of the subject matter herein.

4. Respondent did not fail to comply with 29 C.F.R. 1926.550(a)(15)(i).

## ORDER

Serious citation 1, with its proposed penalty is vacated.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>KANSAS CITY POWER & LIGHT COMPANY, a corporation,<br><br>Respondent. | OSHRC Docket No. 76-5255 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Alan M. Weinman is before the Commission under section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). In his decision, Judge Weinman vacated a citation alleging that Respondent, Kansas City Power & Light Company, committed a serious violation of the "general duty clause," section 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1). 1/ In response, the Secretary of Labor ("the Secretary") filed a petition for discretionary review. Commissioner Cleary then directed review of all of the issues raised by the Secretary's petition, including the principal issue of whether the judge erred in concluding that the Secretary failed to establish that the cited conditions constituted a "recognized hazard" within the meaning of section 5(a)(1). For the reasons that follow, we reverse the judge's decision that the Secretary failed to sustain this burden of proof and remand the case for further proceedings.

---

1/ Section 5(a)(1) of the Act provides that "[e]ach employer . . . shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees."

I

Respondent generates and sells electricity in Kansas City, Missouri. On October 19, 1976, an explosion in the "F" coal pulverizer area of boiler unit 5 at Respondent's Hawthorn Road power plant injured 15 employees. Occupational Safety and Health Administration ("OSHA") compliance officer Garvin Pyron investigated the accident on October 19 through 22, 1976. Consequently, the Secretary issued to Respondent a citation alleging a serious violation of the Act for failure to comply with section 5(a)(1) in that:

> the employer did install, or permit to be installed, tripping devices in the control circuits of the unit number 5 coal pulverizers in such a manner that it is possible for a failure of a raw fuel (coal) feeder to cause both a pulverizer and its associated exhaust to stop instantaneously without purging and while charged with heated partially pulverized coal, thereby increasing the chance of explosion.

To produce electricity at the cited facility, Respondent burns coal in a massive boiler to convert water to steam that is used to generate electricity. The process begins when raw coal is fed by six feeder belts to six pulverizers, where the raw coal is simultaneously heated at 600 to 800 degrees Fahrenheit and ground by rollers to a fine powder. Exhausters attached to each pulverizer carry the powdered coal to the boiler. The coal dust is then injected into the four corners of the boiler at six different levels in a tangential firing process. Control room operators monitor the feeders, the pulverizers, and the boiler with a computer, sensing instruments, and electrical circuits designed to sustain or stop operation under particular conditions.

In this operation, Respondent uses electrical circuitry designed and installed by Combustion Engineering, Inc. One feature of the circuitry, referred to at the hearing as the "adjacent mill trip," electrically interconnects each coal pulverizer and its feeder belt with the feeders that supply adjacent pul-

verizers. As a result of this interconnection, the adjacent mill trip will stop a loaded pulverizer abruptly under certain conditions without purging or exhausting the pulverizer of coal or volatiles. For example, if the feeder belt for F pulverizer trips or stops, the F pulverizer will stop automatically after a 3-second delay if the feeder belt for the adjacent E pulverizer drops to less than 50 percent of its operating speed. Moreover, when the F pulverizer stops under these circumstances, its exhauster also stops, thereby leaving any residual accumulations of partially pulverized coal dust confined within the pulverizer. Compliance officer Pyron, a former control operator at a coal-fired power plant, 2/ surmised that this sequence of events preceded the explosion at issue. In addition, a joint management-labor investigating committee concluded that the adjacent mill trip interlock caused the explosion.

Witnesses for both parties indicated that coal accumulations in pulverizers are subject to spontaneous combustion and explosion. For example, Pyron emphasized that pulverized coal is "at the very best dangerous," and that, even "under the very best of conditions and the closest control," there will be explosions.

Nevertheless, according to Pyron, the circuitry used by Respondent exacerbates the explosion hazard inherent in pulverizer shutdowns because the 3-second delay in the pulverizer trip does not allow sufficient time to exhaust coal dust and gases that accumulate in the pulverizer. Pyron stressed that a pulverizer should not be stopped if "there is any possibility of coal dust or volatile[s]

---

2/ Pyron had worked with the Tennessee Valley Authority ("TVA") as a control room operator at coal-fired generating plants for 12 years, from 1957 until 1969. In addition, Pyron testified that he had experience with Combustion Engineering systems, including the type of pulverizers used by Respondent. However, he admitted he had no operator experience since 1969 and he had no mill circuitry design experience. Pyron also noted that he first heard about adjacent mill trip circuitry only during his investigation.

remaining in it until it has been cooled down except in the most extreme circumstances." 3/ Other control room operators who testified on behalf of the Secretary agreed that failing to exhaust a pulverizer before an automatic trip is a dangerous practice.

The Secretary also submitted evidence, in the form of a list supplied by Respondent, that from March 11, 1971, to March 23, 1977, 19 coal pulverizer explosions at Hawthorn unit 5 had caused external damage. According to this evidence five of these explosions occurred after the incident in question. Although the record does not indicate the cause of these pulverizer explosions, Herbert C. Temme, Respondent's consulting engineer, admitted that the list "indicates more explosions than we would like and maybe than we should expect."

Pyron suggested that Respondent could abate the hazard by removing the adjacent mill trip or by installing a time delay to assure purging of the pulverizers before stopping. In addition, after the explosion at issue, the investigating committee of management and employee representatives recommended removal of the adjacent mill trip. According to Norbert Kurle, a control operator for Respondent and a member of the investigating committee, although management officials had agreed to follow this recommendation, Respondent did not remove the trip.

Respondent's engineering witnesses, Temme and Richard E. Drake II of Combustion Engineering, both opposed removal of the adjacent mill trip on the ground that its purpose was to increase safety by reducing the hazard of boiler explosions. They urged that the interlock is designed to prevent accumulations of

---

3/ Before the hearing, the Secretary stipulated that instantaneous pulverizer trips are appropriate under the following conditions: (1) boiler trips, (2) loss of unit DC power, (3) manual operator control trips, (4) electrical faults in pulverizer drive motors, (5) loss of AC power, and (6) exhauster discharge gate closed. However, in the Secretary's view, tripping a pulverizer under what he deems to be normal conditions, solely based on a reduction in adjacent feeder speed, is unnecessarily hazardous.

coal dust in a boiler that may lack "ignition energy" or flame to consume the coal. Such accumulations of powdered coal exhausted from a tripped pulverizer could lead to a boiler explosion, according to both Temme and Drake. Furthermore, Drake stressed that the Combustion Engineering equipment used by Respondent is specifically designed to comply with the National Fire Protection Association ("NFPA") provision at chapter 85-E, section 583, that in effect prohibits injection of coal into a boiler without flame.

Temme testified that Respondent normally exhausts and cools coal pulverizers as part of its shut down procedure. However, when activated by the tripping of one feeder and the reduced speed of an adjacent feeder, the adjacent mill trip will automatically stop a pulverizer to prevent injection of coal from that pulverizer into a boiler that may lack sufficient flame to consume the fuel, according to Temme.

The Secretary's witnesses disagreed with Temme's view that adjacent mill tripping is necessary because feeder speed somehow "proves" boiler ignition. Instead, they testified that feeder speed does not indicate the lack of boiler ignition or unstable flame and therefore does not warrant an instantaneous trip of a pulverizer and the concomitant risk of a pulverizer explosion. In addition, several operators testified that allowing a pulverizer with a failed feeder to operate until its coal is exhausted into the boiler does not endanger the pulverizer or the boiler. Furthermore, according to operator testimony, other instruments, aside from the feeder trip, are available to show boiler ignition. In addition, there was disagreement among the witnesses as to which alleged hazard, boiler explosions or pulverizer explosions, presented the greater danger to employees.

The Secretary's witnesses also indicated that the questioned circuitry interlock is not commonly used in the utility industry. Compliance officer

Pyron, who had 12 years of experience with the TVA as a control operator, testified generally that tripping a loaded pulverizer is not a common industry practice. William Green, with 26 years of TVA experience, explained that TVA practice is to allow a pulverizer to run until it is exhausted once a feeder trips. Plants under his control had never had a pulverizer explosion when the pulverizer was shut down that way. Earl Wayne Downs, a plant supervisor for South Mississippi Electric Power Association and a former test engineer with TVA experience, testified that, in every location where he had worked, a pulverizer had to be completely empty before it was shut off. For example, Downs explained that the South Mississippi facility uses an interlock that is the opposite of Respondent's circuitry because it is designed to assure that the pulverizer is cleared of charged material before it shuts down. Specifically, the circuitry prevents the pulverizer from being tripped manually for five minutes after its feeder stops. Downs saw no reason for an immediate trip on the pulverizer here within 3 seconds after the feeder stops because, he suggested, exhausting the coal and volatiles from a pulverizer causes no damage to the pulverizer or the boiler. In view of the pulverizer explosion danger, Downs testified that he would not want adjacent mill tripping "in my plant." In addition, both Pyron and Green had operated Combustion Engineering equipment that did not use an adjacent mill trip.

According to Respondent's consultant Temme, however, tripping a pulverizer without purging when a boiler lacks ignition is a common industry practice. Temme named several companies that use an interlock like the adjacent mill trip. In addition, Drake testified that adjacent mill tripping is common to the Combustion Engineering system. Drake also said that Combustion Engineering had installed 250 systems with adjacent mill trips, 150 of which were for coal-fired units. Emphasizing a trend toward automation and away from operator control, Drake

testified that the circuitry interlocks are used increasingly "to assist the operator so that he does not have to have the choice of making an incorrect decision." Drake also testified that the TVA had requested that Combustion Engineering submit a proposal for adjacent mill circuitry at a plant where two boiler explosions had occurred within a year.

In his post-hearing brief, the Secretary contended that stopping a pulverizer without exhausting coal and volatiles is a recognized hazard. The Secretary specifically argued that NFPA Code provisions indicate that the utility industry "for years has recognized the hazards of residual coal charges in pulverizers." In his brief, the Secretary cited NFPA sections on coal-fired boilers and pulverized fuel systems that warn of an explosion danger from heated, pulverized coal accumulations and also detail purging procedures. On the explosion hazard, the Secretary cited section 564, chapter 85-E, of the 1974 NFPA Code, which provides in pertinent part that:

> Pulverizers will, on tripping, have a residual charge distributed primarily in the pulverizer, but also in burner piping and nozzles. This accumulation in a hot pulverizer will generate volatiles that are combustible and explosive.

In addition, this hazard is also mentioned in section 4214, chapter 60, of the 1975 NFPA Code:

> Pulverizers tripped under load will have fuel remaining in the hot pulverizer, burner piping, and burners. These accumulations may cause spontaneous ignition of the fuel or an explosion.

Furthermore, the Secretary argued that purging of pulverizers is specifically required by sections 624 and 6243, chapter 60, 1975 NFPA Code, which provide:

> 624. <u>Clearing Procedures For Pulverizers Tripped Charged With Fuel</u>. In order to minimize hazards caused by accumulations within the pulverized fuel system equipment, as discussed in section 616 [dealing with accumulations at the time of initial start up], the following procedure shall be used to clear fuel from the system as soon as possible after it has been tripped while containing a charge of fuel.

* * *

6243. Continue to operate the pulverizers until empty and in normal condition for shutdown.

Finally, the Secretary emphasized that the NFPA Code contains no provision that approves or provides for either adjacent mill tripping or, except under emergency conditions, stopping a loaded pulverizer without exhausting.

II

Judge Weinman vacated the citation based on his conclusion that the Secretary failed to prove that Respondent's pulverizer control circuitry was a "recognized hazard" under section 5(a)(1) of the Act. In reaching this conclusion, the judge refused to consider the NFPA provisions advanced by the Secretary to support the citation because they were "advisory provisions of newly promulgated national consensus standards." The judge in effect reasoned that it would be inequitable to base a 5(a)(1) charge on the NFPA provisions when Respondent would have been exempt under a "grandfather clause" if the NFPA provisions had been adopted as OSHA standards. However, the judge noted that "[a]dmittedly, Respondent made no effort to clear the pulverizer as recommended [in the NFPA Code]." The judge also found that the engineering testimony of Respondent's witnesses on "other coal-fired generating plants that incorporate adjacent mill tripping in their circuitry" rebutted the Secretary's evidence on industry practice. The judge specifically relied on Drake's testimony that adjacent mill tripping is common to the Combustion Engineering system. He concluded that "neither the collective force of their [the Secretary's witnesses'] opinions nor the history of explosions and injuries . . . is sufficient to establish the existence of a recognized hazard on October 19, 1976, in the face of unrebutted testimony that the disputed circuitry logic was commonly used in the industry."

The Secretary maintains that he established a recognized hazard based on both industry recognition and employer knowledge of an explosion hazard created by tripping a loaded pulverizer.

According to the Secretary, industry recognition is established by the testimony of the compliance officer and operators that (1) a loaded pulverizer should be tripped only in extreme situations and, even then, only if purged, and (2) common TVA practice is to purge pulverizers before they are stopped. The Secretary further maintains that the 1974 and 1975 provisions of the NFPA Code, noted in his post-hearing brief, address the cited hazard and provide "unequivocal evidence" that an industry safety authority recognizes the hazard.

Furthermore, the Secretary contends that Respondent actually knew of the cited hazard. The Secretary notes that Respondent normally purges pulverizers before stopping them to avoid explosions. This "work rule," according to the Secretary, manifests Respondent's understanding of the hazard of allowing coal to remain in an inert pulverizer. In addition, the Secretary charges that Respondent had constructive knowledge of the cited hazard based on (1) evidence of nineteen explosions in six years at the cited facility, (2) testimony that each pulverizer had exploded at some time, and (3) the admission of Respondent's engineering consultant that "there were more pulverizer explosions than we would like." In the Secretary's view, its history at least provided Respondent with notice that its method of pulverizing coal was hazardous.

Respondent contends that the Secretary failed to sustain his burden of proving that the adjacent mill trip is a recognized hazard. Respondent agrees with the judge that the Secretary failed to prove that the use of the adjacent mill trip is against common industry practice. In this connection, it charges that the operator testimony, including the testimony of the compliance officer, is unrepresentative, unreliable and limited because, among other things, these opinions are out-of-date or irrelevant to Respondent's equipment. In contrast, Respondent urges the "wide" experience of its engineering witnesses who explained the circuitry logic and the dangers of not using a trip. Furthermore, Respon-

dent notes testimony on other facilities with similar circuitry interlocks and the industry trend toward plant automation.

Respondent also contends that the judge correctly refused to consider NFPA provisions as evidence of a recognized hazard. Respondent asserts that the Secretary may not rely on an advisory, nonretroactive industry standard not adopted by OSHA to establish a recognized hazard under section 5(a)(1). To decide otherwise violates due process, Respondent reasons, because an employer is entitled to "more notice, more particularity, and more specificity" if the Secretary seeks to prove a general duty clause violation. 4/ Respondent specifically urges that the Secretary must show that the provisions he relies on are actually directed to prevention of the cited hazard. According to Respondent, the provisions here are too ambiguous and general to establish a hazard. Furthermore, if the Commission permits the Secretary to rely on NFPA "advisory" provisions, Respondent urges that it should be allowed to submit evidence on the inapplicability of those standards to the cited facility. Finally, Respondent maintains that none of the Secretary's witnesses testified that it had violated any specific provisions. Respondent specifically notes that it objected to the Secretary's cross-examination on NFPA Code provisions on the ground that the Code was inapplicable to the advanced circuitry at the cited facility.

Respondent also denies actual knowledge that its adjacent mill trip was a recognized hazard. Respondent urges that the Secretary "failed to present any credible proof that <u>any</u> explosion, <u>including the one on October 19, 1976</u>,

---

4/ Nevertheless, despite these assertions, Respondent concedes that "[i]ndustrial operating codes, if established to be widely accepted in the particular industry and applicable to the situation or condition in issue, can be indicative of commonly accepted safety standards." Indeed, it further notes that the parties "have agreed that the National Fire Protection Association Pulverized Fuel Systems Code sets generally recognized industrial guidelines for the area of pulverized fuel systems."

was caused by the adjacent mill trip device. . ." It argues that evidence of past explosions is irrelevant because the Secretary failed to show that the earlier explosions were caused by the trip. In addition, Respondent notes that, before the explosion at issue, no request or recommendation was made to remove the trip.

III

To establish a section 5(a)(1) violation, the Secretary must show, among other things, that the cited employer failed to render its workplace free of a "recognized hazard." A recognized hazard is a condition or practice in a workplace that is known to be hazardous by either the industry in general or the employer in particular. See, e.g., Beaird-Poulan, A Division of Emerson Electric Co., 79 OSAHRC 21/D11, 7 BNA OSHC 1225, 1979 CCH OSHD ¶ 23,493 (No. 12600, 1979). The hazard, not the specific incident resulting in injury, is the relevant consideration in determining the existence of a recognized hazard. See Brennan v. OSHRC (Vy Lactos Laboratories, Inc.), 494 F.2d 460 (8th Cir. 1974); Boeing Co., Wichita Division, 77 OSAHRC 188/D13, 5 BNA OSHC 2014, 1977-78 CCH OSHD ¶ 22,266 (No. 12879, 1977). Moreover, the recognition element of an employer's duty under the general duty clause refers to knowledge of the hazard, not recognition of the means of abatement. General Dynamics Corp., Quincy Shipbuilding Division v. OSHRC, 599 F.2d 453 (1st Cir. 1979). Required abatement is determined by feasibility and an abatement order may prescribe practices of a higher standard than those an industry presently considers to be reasonable. E.g., Williams Enterprises, Inc., 79 OSAHRC 24/A2, 7 BNA OSHC 1247, 1979 CCH OSHD ¶ 23,478 (No. 4533, 1979), aff'd, No. 79-1559 (D.C. Cir. June 9, 1980).

Applying these principles to the case before us, we conclude that the hazard was defined too narrowly when it was formulated in terms of whether use of the adjacent mill trip mechanism was recognized as a hazard. Indeed, both the

judge and Respondent improperly define the hazard at issue in terms of the asserted cause of the specific incident that led to injury and/or the suggested method of abatement, i.e., in terms of the use or nonuse of the adjacent mill trip. We conclude that the hazard here is the danger of pulverizer explosions resulting from accumulations of heated, pulverized coal. Removal or alteration of the adjacent mill trip device to prevent such accumulations is the suggested means of materially reducing this hazard. See Beaird-Poulan, a Division of Emerson Electric Co., supra. Accordingly, the judge erred in deciding that a recognized hazard finding is precluded in this case by Respondent's evidence that the disputed circuitry was "common" to Combustion Engineering equipment and to the utility industry.

Furthermore, we conclude that the judge erred in refusing to consider NFPA Code provisions as evidence of industry recognition of this explosion hazard. Indeed, the courts and the Commission have looked to industry standards in determining industry recognition of a hazard. E.g., Bethlehem Steel Corp. v. OSHRC & Marshall, 607 F.2d 871 (3d Cir. 1979) (Respondent's safety officer admitted that advisory ANSI standard represented industry consensus); Titanium Metals Corp. of America v. Usery, 579 F.2d 536 (9th Cir. 1978) (recognition established by NFPA standard that Respondent helped draft); Betten Processing Corp., 75 OSAHRC 43/E2, 2 BNA OSHC 1724, 1974-75 CCH OSHD ¶ 19,481 (No. 2648, 1975) (judge erred in failing to consider ANSI standard as evidence of recognized hazard). To the extent industry consensus standards reflect an industry's recognition of a hazard, they are relevant, probative evidence of a recognized hazard. 5/ Consequently, the NFPA standards relied on by the Secretary are acceptable proof of industry recognition. These provisions, as set forth above,

---

5/ The due process concerns of Respondent and the judge are based on a misconception of the role of advisory industry standards in section 5(a)(1) cases. The Secretary does not seek in this case to use the NFPA provisions

caution that heated coal that is not exhausted from a pulverizer may explode and they recommend procedures for clearing loaded pulverizers to prevent such explosions. We conclude therefore that these industry standards establish industry recognition of an explosion hazard in pulverizers resulting from heated, pulverized coal accumulations. 6/

In view of this evidence of industry recognition of the explosion hazard that allegedly existed at Respondent's worksite, we reverse the judge's conclusion that the Secretary failed to sustain his burden of proving the recognition element ("recognized hazard") of a section 5(a)(1) violation. Because the judge made no findings or conclusions on the remaining elements of the alleged violation and because the record contains sharply conflicting testimony on certain elements, it is necessary to remand the case for further proceedings.

For these reasons, we reverse the judge's decision and remand the case to the judge for findings and conclusions on the remaining elements of the alleged section 5(a)(1) violation.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: MAR 15 1982

---

(Footnote 5 cont'd)

to define required or prohibited conduct under the general duty clause. Instead, the Secretary properly submits the provisions as evidence of the utility industry's awareness or recognition of the hazard.

6/ We reject Respondent's argument that the NFPA Code does not apply to its facility. Indeed, Respondent concedes that the Code applies generally to pulverized fuel systems and its engineering consultant admitted that the Code contains "a discussion of boilers in general and the order in which trips should work."

ROWLAND, Chairman, Dissenting:

I dissent from the majority's decision to remand this case for further proceedings on the elements of proof of a violation of 29 U.S.C. § 654(a)(1). In my view, Judge Wienman properly held that the Secretary had failed to demonstrate the existence of a recognized hazard in Respondent's worksite. 7/ However, while I would affirm the judge's decision to vacate the citation, I do not fully agree with the judge's reasoning in support of his conclusion that a recognized hazard was not shown. Specifically, I share the majority's view that the judge did not properly define the recognized hazard at issue in this case, but I would apply a different definition of the hazard than does the majority. I also do not agree with the majority that the judge erred in his treatment of the National Fire Protection Association (NFPA) codes.

As explained in more detail below, the basic question in this case is whether Respondent is justified in its belief that the inherent and unavoidable hazard of a pulverizer explosion is preferable to an explosion in the boiler or furnace which potentially can have far more serious consequences. While no one disputes that it is desirable where possible to purge pulverizers prior to stopping them, this procedure cannot be adopted in certain limited situations where in Respondent's considered judgement it cannot be certain that a safe level of ignition exists in the furnace.

Before proceeding to the merits of this case, however, I must address a preliminary matter regarding the proper definition of the recognized hazard to be applied.

---

7/ Since the existence of a recognized hazard is the first element of proof in establishing a violation of section 654(a)(1), it is unnecessary to consider the remaining elements, such as proof of feasible abatement methods, when, as here, the Secretary has not shown that the employer failed to keep its workplace free from a recognized hazard. BASF Wyandotte Corp., 81 OSAHRC , 10 BNA OSHC 1250, 1982 CCH OSHD ¶ 25,831 (No. 78-2316, 1981).

I.

As the majority correctly observes, the judge adopted an extremely narrow definition in that he required the Secretary to prove that Respondent's pulverizer trip circuitry mechanisms are understood as hazardous either by Respondent or by its industry. The majority rejects this definition in favor of an extremely broad definition which characterizes the hazard in generic terms as the hazard of explosion caused by the accumulation of coal in a heated pulverizer. As the majority itself notes, however, the Secretary alleged in his citation and argues in his brief yet a third formulation of the hazard--an increased likelihood of explosion resulting from Respondent's practice, in certain situations, of allowing a pulverizer to stop before it has been exhausted of coal and volatile gases. For the reasons that follow, I conclude that the definition presented by the Secretary is the appropriate formulation of the hazard in the circumstances of this case.

The requirement stated in 29 U.S.C. § 654(a)(1) that an employer provide employment and a place of employment "free from recognized hazards" imposes a broad obligation on the employer which is analogous to that imposed by the Secretary's standards regarding personal protective equipment, which also require the employer to protect against "hazards." In order to avoid the problem of fair notice inherent in such broadly-worded standards, it is well settled that they must be defined and limited by objective criteria sufficient to apprise an employer of his obligations. E.g., Ryder Truck Lines v. Brennan, 497 F.2d 230 (5th Cir. 1974); Voegele Co., 79 OSAHRC 76/A2, 7 BNA OSHC 1713, 1979 CCH OSHD ¶ 23,860 (No. 76-2199, 1979), aff'd, 625 F.2d 1075 (3d Cir. 1980); Owens-Corning Fiberglas Corp., 79 OSAHRC 26/D6, 7 BNA OSHC 1291, 1979 CCH OSHD

¶ 23,509 (No. 76-4990, 1979), aff'd, 659 F.2d 1285 (5th Cir. 1981). Similarly, with respect to 29 U.S.C. § 654(a)(1) the court in National Realty & Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973) held that Congress intended to impose an "achievable" duty by which employers would be required to eliminate only those hazards which experts familiar with the industry would consider preventable. See Frank Briscoe Co., 76 OSAHRC 129/A2, 4 BNA OSHC 1729, 1976-77 CCH OSHD ¶ 21,162 (No. 7792, 1976).

In my view, to afford an employer adequate notice of the scope of its obligation under section 654(a)(1) to keep the workplace "free from recognized hazards," the alleged hazard should be defined in terms of work practices or processes involved in the workplace in question over which the employer can reasonably be expected to exercise control. Otherwise, it cannot be said that the hazard would be preventable in the ordinary course so as to render the employer's duty the achievable one intended by Congress. While the degree of specificity required will depend upon the circumstances of each individual case, here the majority's broad, generic definition of the hazard--coal dust explosions in pulverizers--does not direct Respondent's attention to a hazard which it could reasonably consider to be preventable.

In this case, it is obvious that pulverizers are understood both by Respondent and by the electric utility industry to present the hazard of explosion due to accumulated coal dust. Indeed, the provisions of the NFPA codes demonstrate that the hazard of an explosion caused by accumulated coal dust within a pulverizer is understood by the industry to be a normal incident of operations. Nothing in the provisions cited by the majority gives any indication that such accumulations are not normally anticipated to occur or that

explosions from such accumulations are not to be expected. 8/

Accordingly, the majority's definition of the hazard as an explosion from accumulated coal dust within a heated pulverizer is inadequate under 29 U.S.C. § 654(a)(1), because Respondent would not regard the duty imposed upon it by this definition to be achievable. Plainly, the reasonable employer in Respondent's industry would not consider the hazard of an

---

8/ Although as the majority notes, Respondent's engineer Temme testified to the effect that the explosions which had previously occurred in the facility exceeded in frequency what he would "like" and "maybe should expect," this opinion was only tentative. Temme was responding to a question from the judge as to whether in his judgment "that record [the prior explosions] indicate that there is either some design or operating problem with respect to the No. 5 unit?" He prefaced his answer with the explanation that the question was "probably unfair" because he had not "had a chance to evaluate the operation of that unit in detail." There is also evidence that none of the other explosions had resulted in any injury to employees. The record, therefore, is not sufficient to establish that Temme was on notice from the occurrence of other explosions of any deficiency in Respondent's operating procedures, or in the design and construction of its facility, nor does it demonstrate that any employer in Respondent's industry would consider these prior incidents to be excessive either in frequency or severity.

Indeed, section 5311 of NFPA No. 60, the Standard for Installation and Operation of Pulverized Fuel Systems, emphasizes that pulverizers are designed with the expectation that explosions will occur: "All equipment of the pulverized fuel system which may contain pulverized fuel laden air . . . shall be designed . . . for containment of a possible internal explosion . . . ." This code also prescribes specific strength requirements for the construction of various parts of the pulverizer, but not including ductwork. See section 53112. The record shows that the explosion which resulted in the inspection in this case as well as the other explosions caused damage to ductwork but not to the pulverizers themselves.

explosion in a pulverizer to be preventable. 9/

In this case as the majority notes the citation alleged, and the compliance officer testified to, a hazard predicated on a particular operating practice of Respondent--that under certain conditions a heated pulverizer containing accumulated coal could be stopped without being purged. Furthermore, the citation allegation, which is reiterated in the Secretary's complaint, makes it clear that the Secretary's concern is not the inherent possibility of explosion in pulverizer operations, but rather a hazard which would be considered preventable because it is created by a particular operating procedure. I would accept the Secretary's definition of the hazard as sufficient to give Respondent

---

9/ In a case analogous to this, the Second Circuit held that the Commission erred in defining the hazard presented by a facility used for the storage of both acids and cyanides as the formation of hydrogen cyanide (HCN), a lethal gas. Pratt & Whitney Aircraft v. Secretary of Labor, 649 F.2d 96 (2d Cir. 1981). Noting that there is no dispute that uncontrolled formation of HCN at a place of employment would be recognized as a hazard, but further observing that no evidence showed that HCN had ever been formed at the employer's facility, the court held that the hazard could not properly be defined as uncontrolled formation of HCN, but rather "must have been a condition that might result in the generation of that lethal gas." Specifically, the court concluded that the Secretary was required to demonstrate that the manner in which Pratt & Whitney stored its chemicals was known as hazardous. The court found such proof based on the undisputed evidence that the industry generally stored acids and cyanides separately with separate drains so as to protect against the formation of HCN in storage areas. 649 F.2d at 101.

This case is distinguishable from Pratt & Whitney in that coal dust explosions do occur whereas in Pratt & Whitney the hazard alleged by the Secretary and found by the Commission--formation of a lethal gas--had not been known to have occurred previously in the employer's facility. Nevertheless, Pratt & Whitney does stand for the proposition that the hazard must be defined in sufficiently specific terms to give the employer notice of its obligations under 29 U.S.C. § 654(a)(1).

notice of its duty in the circumstances of this case. 10/

II.

As the majority properly observes, a hazard alleged to be recognized under 29 U.S.C. § 654(a)(1) must be known as hazardous by either the industry in general or the employer in particular. In my view, the Secretary failed to establish that either Respondent or the industry as a whole recognize that it is hazardous to stop a heated, charged pulverizer under the conditions at issue in this case.

The Secretary presented the testimony of a number of employees as well as the compliance officer to the effect that pulverizers should not be stopped under such conditions. However, neither the compliance officer nor the employee witnesses had any experience or training in the design or engineering of coal-fired boiler systems, and in particular in the design of pulverizer circuitry. As the majority notes, compliance officer Pyron also had no operator experience

---

10/ Although the majority acknowledges that the Secretary described the hazard - in both his brief before the judge and his brief before the Commission - in terms of stopping a pulverizer before it is purged, the majority states no reason for adopting a different formulation other than its belief that it is improper to define the recognized hazard in terms of the means of abatement sought by the Secretary. The majority does not even give consideration to the Secretary's definition of the hazard despite the fact that the Secretary's definition is not addressed to a specific abatement method. Although the citations and complaint refer to Respondent's tripping mechanisms, it is clear that the gravamen of the Secretary's charge is the failure to purge heated, charged pulverizers prior to stopping them.

Since I find the Secretary's formulation adequate, I need not consider at this time whether it is improper to define the hazard in terms of the specific abatement method. Furthermore, since, as discussed infra, I would vacate for failure of the Secretary to prove his allegation, I need not now consider whether the majority is correct in its additional conclusion that in entering an abatement order for a violation of 29 U.S.C. § 654(a)(1) the Commission can require an employer to institute measures which exceed those presently understood as reasonable in the employer's industry.

since 1969. According to Drake, who had been employed for 12 years as a systems engineer for Combustion Engineering, the manufacturer of Respondent's boiler control system, the design of these systems has become far more sophisticated since the 1960's, consistent with a trend in the utility industry to automate the control operations as much as possible. Drake specifically testified that Pyron had not worked at any facility having the type of burner control system which Combustion Engineering had installed at Respondent's plant. According to Drake, it is a basic principle of operation of coal-fired furnaces to insure that boilers contain a sufficient level of ignition to maintain combustion of the amount of fuel, in this instance coal, being introduced into the boiler. He indicated that this principle is embodied in the NFPA codes, 11/ and he gave his opinion that discharging a pulverizer into the boiler without establishing an adequate level of ignition would not comply with the NFPA code.

Temme, Respondent's consulting engineer with 26 years experience in the design, construction, and operation of electric utilities, gave similar testimony. In his view, it is essential to insure that the furnace has sufficient ignition energy to consume immediately the fuel being injected

---

11/ He referred to section 573 of NFPA No. 85E, which is entitled "Standard for Prevention of Furnace Explosions in Pulverized Coal-Fired Multiple Burner Boiler-Furnaces." This section provides in pertinent part,

> A common emergency may arise due to a raw coal hangup or threatened unstable flame conditions due to wet coal or change in coal quality. . . . . If coal feed to an offending pulverizer subsystem can be restored or adequate ignition energy can be supplied before main burner ignition is lost, the subsystem may be continued in service provided the flame is stable. However, if the main burner flame on any burner of any pulverizer subsystem is extinguished . . . then that burner or subsystem shall be shut down in a way that will prevent coal being reintroduced to the furnace in a random manner.

into it in order to avoid an explosion caused by accumulation of raw fuel. He considered a furnace explosion to have far more serious consequences than an explosion in a pulverizer. When asked whether, as the Secretary's witnesses contended, it is improper to shut down a pulverizer on the basis of a certain feeder speed before the pulverizer is purged of its fuel and volatile gases, Temme replied candidly that "there are real, honest differences of opinion on how best to handle the mill [pulverizer] under that circumstance." He expressed his opinion that "there is nothing wrong and probably very good judgment" to stop the pulverizer "when we get in a situation that we do not have ignition energy proved." He based this opinion on his belief and on his observations that when an operator is losing or has lost fuel output from a pulverizer, the operator is more concerned with bringing other pulverizers on line to sustain ignition in the furnace than with the status of the pulverizer which has lost output, and consequently the operator may not have time to shut down that pulverizer through the normal purging procedure. While acknowledging that other opinions may exist and that the recommended practices may vary among manufacturers, Temme concluded that the procedure he described, and which Respondent instituted, "is a commonly used technique."

In evaluating the weight to be given to opinion testimony, the Commission must consider a number of factors, including the knowledge and experience of the witness in the subject matter of his testimony and the reasoning with which his opinion is supported. Air-Kare Corp., 81 OSAHRC , 10 BNA OSHC 1146, 1981 CCH OSHD ¶ 25,758 (No. 77-1133, 1981) (dissenting opinion). In this case, Respondent's witnesses are more qualified to testify with respect to the design of Respondent's facility and in particular with respect to the philosophy and logic on which the mill trip in question here is based.

Furthermore, both Temme and Drake specified in some detail the basis for their opinions in terms of their observations and the factors which they indicated were taken into consideration in the circuitry design. On the other hand, the opinions of the Secretary's employee witnesses were not based on any assessment of design philosophy, nor did the employees state any basis for their opinion other than their unsubstantiated belief that the speed of an adjacent feeder is not as reliable an indicator of the level of ignition in the furnace as is an operator's judgement. Temme, who as indicated has greater familiarity with matters of design, testified without rebuttal that the control system incorporates a signal which indicates whether there is weight on the feeder belt and that the feeder cannot operate at a 50 percent speed unless it has a load on the belt. On this basis, Temme stated that the correlation between a feeder speed of 50 percent or better and any actual coal feed of the same magnitude is "very high." This opinion was corroborated by Drake, who said that in Combustion Engineering's design the operation of an adjacent pulverizer feeder is a reliable indication of the level of ignition in the furnace. Accordingly, the Secretary has not shown by a preponderance of the evidence that Respondent had actual knowledge that under the circumstances presented in its operation a shutdown of a pulverizer prior to purge is hazardous. 12/

Nor does the record show that the industry as a whole recognizes that it is hazardous to stop a pulverizer prior to purging. At best, the testimony is conflicting regarding industry custom and practice. Although Pyron

---

12/ The history of prior explosions does not show the contrary. An unspecified number of these explosions had occurred while pulverizers were being purged in the manner advocated by the Secretary, that is, before the pulverizers were shut down.

possessed operating experience with other facilities using Combustion Engineering equipment which did not apply an immediate pulverizer trip, his operating experience was limited to a period of time prior to the fundamental change in the theory of boiler control circuitry design on which the shutdown without purge is based. While witness Green did have current operating (but not design) experience with Combustion Engineering equipment at TVA, his testimony regarding the practice in TVA facilities is not persuasive in view of Drake's unrebutted statement that in 1976 one TVA facility, Widow's Creek, requested that Combustion Engineering install a burner control system similar to that of Respondent's plant after two explosions in the furnace had occurred. As the majority indicates, Combustion Engineering has installed 250 such control systems, most of which are used in coal-fired units. The widespread use of control circuitry of the type installed in Respondent's facility represents at least some consensus in the industry that the circuitry design is capable of properly detecting an inadequate ignition level and that it is acceptable to stop a pulverizer prior to purging when an inadequate ignition level in the furnace does not exist.

Nor do the provisions of the NFPA standards require an opposite conclusion. The cases cited by the majority support the proposition that proprietary standards of private organizations, such as the NFPA, are relevant but not dispositive on the question of industry recognition. For example, in Bethlehem Steel Corp. v. OSHRC, 607 F.2d 871 (3d Cir. 1979), the court noted both the employer's concession that the standard represented an industry consensus and the compliance officer's testimony regarding the practices of other employers. In Titanium Metals Corp. of America v. Usery, 579 F.2d 536 (9th Cir. 1978) the totality of the evidence consisted of the employer's own experience, employee complaints, and adoption of a safety program as well as the provisions of the NFPA code.

Furthermore, in this case the NFPA provisions indicate that the industry as a whole does not regard Respondent's practice as hazardous. In particular, section 624 of NFPA No. 60, quoted in part in the majority opinion, on its face assumes that pulverizers will be tripped under a load condition in normal operations. Additional provisions of the clearance procedure, which the majority fails to quote, indicate that the requirement that the pulverizer remain in operation contemplates a restart of the pulverizer after it has been tripped, rather than, as the majority erroneously suggests, that the pulverizer cannot be tripped until it is purged. Also, no time period is prescribed for the clearance procedure other than a provision that the fuel load be cleared "as soon as possible." Section 565 of NFPA No. 85E imposes an essentially similar sequence of clearance steps, 13/ but does not contain the "as soon as possible"

---

13/ These provisions provide in full as follows:

NFPA No. 60-1973

624. Clearing Procedures for Pulverizers Tripped Charged with Fuel. In order to minimize hazards caused by accumulations within the pulverized fuel system equipment, as discussed in Section 616, the following procedure shall be used to clear fuel from the system as soon as possible after it has been tripped while containing a charge of fuel.

6241. Isolate all shutdown or tripped pulverizers as recommended by manufacturer.

6242. Start up one pulverizer in accordance with the principles and sequences listed in Section 621 (a) through (f).

6243. Continue to operate the pulverizer until empty, and in normal condition for shutdown. When the operating pulverizer is empty of fuel, proceed to another pulverizer and repeat the procedure until all are cleared of fuel.

(Continued)

requirement. 14/

NFPA No. 85E-1974

565. Clearing Procedure for Pulverizers and Fuel Burning Equipment

In order to minimize hazards caused by accumulations within the pulverizer, as discussed in 564, the following procedure shall be used to clear coal from the pulverizing and fuel burning equipment after a master fuel trip or a trip of individual pulverizers.

(a) Isolate all non-operating or tripped pulverizers from the furnace.

(b) Purge the furnace and start up in accordance with 522 (a) through (i) following a boiler fuel trip.

(c) Light the igniters on all burners of the pulverizer to be cleared. After making sure that the igniters are lighted and are providing appropriate ignition energy for the main burner, start the pulverizing equipment following the equipment manufacturer's recommendation.

(d) Continue to operate the pulverizer until empty, and in a normal condition for shutdown. If boiler conditions will permit a firing rate greater than the capacity of one pulverizer operating within its normal operating range, the first pulverizer should be kept in operation in accordance with 564. If the first pulverizer cannot be left in service, shut it down in the prescribed manner leaving it cool and as free of coal as practical.

(e) Repeat the procedure for all other pulverizers that had been tripped charged with coal. The procedure and operating principles outlined in Section 55 and 564 should be followed.

(Emphasis added.)

14/ In his brief the Secretary argues that section 624 of what he identifies as the "1975" edition of NFPA No. 60 contains the same provisions as the 1974 edition of NFPA No. 85E. I have not been able to locate an edition of NFPA No. 60 dated 1975. There is, however, an edition dated 1973, the provisions of which are identical to those quoted by the Secretary. I will assume that the Secretary while referring to NFPA No. 60-1973 inadvertently misidentified that code as a 1975 edition. Contrary to the Secretary's assertion, the provisions of the two codes, NFPA No. 60 and NFPA No. 85E, are not the same in that the phrase "as soon as possible" appears in the 1973 edition of NFPA No. 60 but not in the later, 1974, edition of NFPA No. 85E. The deletion of this language suggests that the industry no longer makes any recommendation regarding the period of time for restarting a pulverizer which has been tripped while containing an

(Continued)

In any event, as Judge Wienman properly determined, the NFPA codes are advisory insofar as they exempt pre-existing installations such as Respondent's. Under Commission precedent, therefore, the NFPA codes cannot be used to establish recognition of a hazard under 29 U.S.C. § 654(a)(1). A. Prokosch & Sons Sheet Metal, Inc., 80 OSAHRC 96/A2, 8 BNA OSHC 2077, 1980 CCH OSHD ¶ 24,840 (No. 76-406, 1980). 15/

For these reasons, I would affirm the judge's decision to vacate the citation.

---

14/ (Continued)

accumulation of heated coal. This significant change in the requirements of the NFPA codes over a short period of time further supports the conclusion that the NFPA standards should not be used as dispositive proof of industry recognition of a hazard. Indeed, both codes expressly caution that their requirements must be tailored to both changes in technology and the particular circumstances of individual plants. Section 12 of NFPA No. 60 states:

> No standard can be promulgated which will guarantee the elimination of pulverized fuel system explosions. Technology in this area is under constant development which will be reflected in revisions to this Standard. The user of this Standard must recognize the complexity of pulverized coal firing as to the types of equipment and the characteristics of the fuel. Implementation of this Standard depends upon the judgment of the designer and the operator to suit the specific conditions under his responsibility (emphasis added).

The foreword to NFPA No. 85E contains similar language with respect to furnace explosions.

15/ Contrary to footnote 5 of the lead opinion, the advisory nature of the NFPA standards extends to the conduct at issue in this case because, as I have explained, the hazard of which recognition must be shown involves a specific work practice of the employer. Since the majority errs in its definition of the hazard in broad, generic terms, its conclusion that the NFPA codes can be used for showing recognition of this hazard is misplaced.

| SECRETARY OF LABOR,<br><br>Complainant<br><br>v.<br><br>KANSAS CITY POWER & LIGHT COMPANY,<br>A CORPORATION,<br><br>Respondent | DECISION & ORDER<br>OSHRC DOCKET 76-5255 |

APPEARANCES: JOHN WEISS, Esq., and KATHLEEN MCCARTHY, Esq., Office of the Solicitor, U.S. Department of Labor, Kansas City, Missouri, for the Complainant

PAT SHANNON, Esq., and LYNN M. SNELGROVE, Esq., Law Department, Kansas City Power & Light Company, Kansas City, Missouri, for the Respondent

Wienman, Judge, OSHRC:

## STATEMENT OF THE CASE

This is a proceeding pursuant to section 10 of the Occupational Safety and Health Act of 1970 (29 USC 651 *et seq.*, hereafter called the Act) contesting a citation for serious violation issued to Respondent November 24, 1976, under the authority vested in Complainant by section 9(a) of that Act. The citation resulted from an inspection of Respondent's generating plant at 8700 Hawthorne Road, Kansas City, Missouri, subsequent to a coal

grinding mill (pulverizer) explosion which occurred on October 19, 1976.

The citation alleged a serious violation of section 5(a)(1)[1/] of the Act, the so-called "general duty clause," described as follows:

> "1. Public Law 91-596, Section 5(a)(1): The employer did not provide his employees at the Hawthorne Power Plant employment and a place of employment which was free from the recognized hazards that were causing or likely to cause death or serious physical harm to his employees in that the employer did install, or permit to be installed, tripping devices in the control circuits of the unit number 5 coal pulverizers in such a manner that it is possible for a failure of a raw fuel (coal) feeder to cause both a pulverizer and its associated exhaust to stop instantaneously without purging and while charged with heated partially pulverized coal, thereby increasing the chance of explosion.
>
> a) Unit number 5."

The Secretary proposed an $800 penalty and abatement of the alleged violative conditions by December 24, 1976.

Respondent timely contested the alleged violation, and a hearing was held in Kansas City, Missouri, on May 19 and 20, 1977, with both parties present and participating.

Subsequent to the initial hearing, the undersigned Judge informed the parties that he was unable to ascertain from the transcript, as reported, the physical factors necessary to actuate

---

1/ Section 5. (a) Each employer--

(1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees; 29 USC 654(a)(1)

the control circuitry interlock device referred to as an "adjacent mill trip." The parties were requested to confer and submit an agreed written description of the trip mechanism (J-32). When the parties reported disagreement on this point, a supplemental hearing was conducted on November 11, 1977, at Kansas City, Missouri, for the limited purpose of receiving testimony relative to the interlock and correcting transcript errors. Both parties appeared by counsel; each presented one witness. At the conclusion of the testimony counsel read an agreed list of transcript corrections (T. 425-437).

## THE ISSUES

No jurisdictional issues are in question, the parties having pleaded facts sufficient to establish that the Respondent is subject to the Act, and that the Commission has jurisdiction of the parties and the subject matter. The general issues are whether the Respondent violated section 5(a)(1), the general duty clause of the Act, and if so, what penalty is appropriate therefor. A determination of the general issues depends on findings resolving a technological dispute, the nature of which is described in the following paragraphs.

Complainant's investigation of an explosion at Respondent's Hawthorne Unit Number 5 generating facility in Kansas City was conducted by Garvin Pyron, an OSHA Compliance Officer. Mr. Pyron, whose work experience prior to joining the Department of Labor included 12 years as a unit operator in a coal-fired Tennessee

Valley Authority generating plant, reached two conclusions which resulted in OSHA citations.

Noting that both the physical damage and eyewitness reports indicated that a coal pulverizer explosion on the morning of October 19, 1976, blew up metal duct work and ignited secondary explosions which injured 15 employees, Pyron posited:

1. The initial explosion was caused by an unnecessary and dangerous control circuitry interlock which abruptly tripped or stopped a loaded pulverizer without purging its volatile contents. This was the premise of Citation Number 1 which is disputed in this proceedings.

2. The secondary explosions were fueled by heavy accumulations of coal dust in and near the "coal alley" of Hawthorne Unit Number 5. This was the premise of Citation Number 2 which alleged a repeat violation of regulation 29 CFR 1910.22(a)(1). Respondent did not contest this citation, but paid an $1800 penalty and instituted abatement efforts to correct the coal dust problem (T. 339).

The critical issue for resolution herein is: Did the pulverizer control circuitry at Hawthorne Unit 5 constitute a "recognized hazard" within the meaning of section 5(a)(1) of the Act?

## SUMMARY OF THE EVIDENCE AND DISCUSSION

The parties presented 11 witnesses, all of whom boasted some experience in operation or design of coal-fired generating plants. Complainant's witnesses were men who had served as unit control

operators, and they tended to denounce the interlock device as unnecessary and dangerous. Respondent countered with the testimony of two engineers, Herbert C. Temme and Richard E. Drake, II, who defended the pulverizer trip as an important element of the design logic for prevention of boiler explosions.

The sharp division in opinion not only encompassed the physical function and rationale of the circuitry but extended to the nomenclature witnesses employed to describe the interlock. Mr. Pyron and other witnesses for Complainant referred to the disputed device as an "adjacent mill trip," a phrase Mr. Temme objected to because he preferred to describe the circuitry in terms of conditions necessary to sustain, rather than to stop or trip operations (T. 380). The phrase, however, is useful as a shorthand reference to the disputed circuitry and is employed for convenience sake in the following summary of the pertinent physical facts.

In generating electric power at Unit Number 5 of its Hawthorne plant, Respondent burns coal in a massive furnace or boiler which converts water into steam to operate a power generating turbine. Before entering the boiler the coal is fed by rotating belts into one of six pulverizers or mills where it is simultaneously heated to a temperature of 600 to 800 degrees and ground by rollers to the consistency of fine face powder (T. 29, 31, 34, 37-38, 288).

Hawthorne Unit 5 is equipped with six mills (denominated A, B, C, D, E, and F), each fed by separate belt from coal stored at an upper level. Each mill has separate piping feeding the pulverized

coal to the furnace where it is injected at different levels.

The feeders, mills, and furnace are monitored by unit operators who are aided by sensing instruments, a computer, and complex electrical circuits designed to sustain or trip operations, in whole or part, under various conditions.

One feature of the circuitry, the disputed "adjacent mill trip," is an interlock which functions only after three minutes of stable operations. Each pulverizer and its supply feeders are electrically interconnected with the feeders which supply adjacent pulverizers. If the feeder for one of the two end pulverizers ("A" and "F") trips or stops, the pulverizer itself will automatically trip or stop after a three second delay if the adjacent pulverizer feeder is operating at a speed of less than 50 percent.

Example: The feeder to "A" pulverizer trips while the feeder to "B" pulverizer is operating below 50 percent. Pulverizer "A" automatically trips three seconds later. Similarly, if the feeder to "F" pulverizer trips while "E" feeder is operating below 50 percent, pulverizer "F" trips after three seconds.

The circuitry is somewhat different for pulverizers "B," "C," "D," and "E." Each of these pulverizers is sustained by the operation of two adjacent feeders. For example, "C" pulverizer is interlocked with "B" and "D" feeders. Therefore, if "C" feeder stops, "C" pulverizer will not trip automatically unless both "B"

and "D" feeders are operating below 50 percent.[2/]

The history of Hawthorne Number 5 lends some support to Complainant's claim that the disputed trip is prone to cause explosions. The computer printout on October 19, 1976, indicated that "F" coal feeder had tripped at the approximate time of the explosion (T. 14), and an investigating committee later concluded that the adjacent mill trip was the cause of the explosion. Among its recommendations the investigating committee listed removal of the adjacent mill trip (T. 148).

During a six year period from March 1971 to March 1977 there had been 19 pulverizer explosions at Hawthorne Number 5 which resulted in external damage (T. 294-295). Although the record does

---

[2/] The above skeletal description of "adjacent mill tripping" purposefully ignores the unit load in the furnace as a factor affecting the disputed trip. Mr. Temme, who delivered a prolix explanation of the control circuitry which at one point stretched unbroken through 18 pages of transcript (T. 238-256), introduced an element of confusion by testifying that ". . . the adjacent mill trip opoperates only if the adjacent feeder is below 50 percent and the unit load is below 30 percent" (T. 363). However, he later agreed that "adjacent mill tripping does work when the unit boiler load . . . is above 30 percent" (T. 389). A unit load above 30 percent apparently is necessary to sustain combustion as the overall circuitry is designed, but a pulverizer may be subject to an "adjacent mill trip" while the unit load is above 30 percent.

Ironically, Mr. Temme's initial emphasis on unit load as a factor in "adjacent mill trip" logic trapped counsel for Respondent into submitting the following argument: "Counsel for Complainant and Mr. Pyron's understanding of adjacent mill tripping (T. 39) is inaccurate and misrepresentative in that they completely discount or forget that the entire unit must be at a unit load of below 30 percent" (Respondent's Exceptions to Findings of Fact Proposed by Complainant, 1).

Needless to add, this episode would not have been weighed as a plus for Respondent had credibility determinations been critical to the decision.

not indicate if these explosions occurred in mill trip situations, Mr. Temme, the consulting engineer who is working on "major modifications" of Hawthorne Number 5, candidly stated "that indicates more explosions than we would like and maybe that we should expect" (T. 295).

Complainant links this history of explosions with the unit operators' testimony that an abrupt mill trip without purging is dangerous in an effort to establish a "recognized hazard" under section 5(a)(1). But the difficulty with the Complainant's case is that it rests largely on opinion, and there is contrary opinion--not as persuasive perhaps, but bona fide and also rooted in safety considerations.

The logic of the adjacent mill trip was defended by both engineers, Temme and Drake, as a safety interlock designed to prevent the buildup of fuel in a boiler where there may be inadequate ignition energy, a condition which conceivably could lead to a boiler explosion. Since boiler explosions are rare events,[3/] the wisdom of the interlock, when viewed with the benefit of our hindsight, is now open to serious question. But a judgment to condemn the circuitry logic after unsatisfactory experience, even though that experience includes serious injuries to numerous employees, is not tantamount to proof that the circuitry was known to constitute

---

3/ See, Combustion Engineering, A Reference Book on Fuel Burning and Steam Generation, p. 17-15, attached to Complainant's Memorandum in Support of Proposed Findings as "Appendix F."

a recognized hazard prior to the October 19, 1976, explosion.

In an ultimate effort to establish this key element of a section 5(a)(1) charge, Complainant, in its brief, calls our attention to certain provisions in National Fire Code No. 85E, the 1975 Standard for Prevention of Furnace Explosions in Pulverized Coal-Fired Multiple Burner Boiler-Furnaces.

Specifically, Complainant first cites provisions which warn that tripping pulverizers under load may cause explosions because the accummulated fuel will generate volatiles and then quotes section 624 of NFC No. 85E, a section which sets forth clearing procedures for pulverizers tripped while charged with fuel. Admittedly, Respondent made no effort to clear the pulverizer as recommended.

The National Fire Code, Complainant suggests, "affirms Pyron's conclusion that tripping a loaded pulverizer is a recognized hazard."

Not quite so, but the very argument points up the difficulty of resolving a dispute concerning the safety of technology employed in a pulverized coal-fired generating plant.

No. 85E of the National Fire Code itself illustrates the problem. Although promulgated as a "Tentative Standard" in May 1918, it was not officially adopted as an NFC standard until 1971, approximately two years after the installation of Unit No. 5 (T. 159). The clearing procedures quoted by Complainant appeared in 1973 amendments which included new sections on Purging After an

Emergency Trip, and specifically apply only to units placed in operation subsequent to June 1, 1974.

The Foreword to No. 85E to this day reflects a continuing disposition on the part of its authors to stress the tentative nature of its proposals:

> " * * *
> No standard can be promulgated which will guarantee the elimination of furnace explosions. Technology in this area is under constant development which will be reflected in the revisions to the standard. The users of this Standard must recognize the complexity of fuel firing, both as to types of equipment and the characteristics of the fuel. Implementation of this Standard depends upon the judgment of the designer and the operator to suit the specific conditions under his responsibility."

Section 13 of No. 85E exempts existing installations but encourages adoption of "those features of this Standard which are considered applicable and reasonable for existing installations." Complainant's argument, thus based on the National Fire Code, raises interesting questions.

Can Respondent be charged with an OSHA violation by flaunting "advisory" provisions of the National Fire Code? Did Respondent have a responsibility to implement "advisory" standards by prompt adoption of the recommended technology as part of its general duty to provide employees with a safe workplace?

The case would present no difficulty if the Secretary had by section 6(a) rule promulgated as an OSHA standard the pulverizer clearing provisions of NFC No. 85E. In such circumstances

Commission precedent holds that a citation for a violation of section 5(a)(1) is invalid and will not lie where a duly promulgated occupational safety and health standard is applicable to the condition or practice that is alleged to constitute a violation of the Act. See, Secretary v. Brisk Waterproofing Company, Inc., BNA 1 OSHC 1263, CCH OSHD 1973-1974, para. 16,345 (No. 1046, 1973). Adoption of NFC No. 85E as an OSHA standard would have provided Respondent with a defense to an enforcement action brought under either section 5(a)(1) or 5(a)(2) for not only would a specific standard apply to the cited condition, but the express terms of the standard would have exempted a 1969 installation.

What then should be the rule where a national consensus standard which has only advisory application to the cited condition and has not been adopted as a specific OSHA standard is violated? May the employer be properly cited for a "general duty" violation for failing to modify an existing facility or practice in accordance with the advisory provisions? Does adoption of a newly promulgated national consensus standard by an industry committee create general duties under section 5(a)(1) for all employers in the industry irrespective of the committee's intent?

We think not. There are some obvious difficulties in framing a general rule, but we believe the better course would be to make advisory provisions of newly promulgated national consensus standards unavailable as proof of a general duty violation. And we would make their advisory classification unavailable as a defense

to a section 5(a)(1) action where the evidence indicates the employer had actual knowledge from other facts and circumstances that the practices or conditions were indeed hazardous.

This conclusion obviates the necessity of burdening this decision with a detailed summary of the witnesses' sharply conflicting opinions about the explosion hazard related to abrupt tripping of loaded pulverizers. Again Messrs. Temme and Drake defended the Respondent's practice in a field where Complainant's lesser educated troops appeared to have preempted the higher and more commanding ground.

This observation reflects a layman's judgment in a purely technological area and is, to some degree, colored by the knowledge that neither of Respondent's expert witnesses was totally devoid of self interest. Mr. Temme, as noted, is a member of an engineering firm employed by Respondent, while Mr. Drake is a control system engineer employed by Combustion Engineering, manufacturer of the boiler-furnace equipment. Respondent occupied a position as client or customer in both instances, and the testimony of the two engineers must be scrutinized with this fact in mind.

Nevertheless, while frankly skeptical of much of the engineering testimony, we note that in one most vital area neither Temme nor Drake was rebutted. Both testified that other coal-fired generating plants incorporate adjacent mill tripping in their circuitry (T. 283-284, 325). Complainant failed to demonstrate

that this testimony was false or inaccurate,[4/] and it impacted heavily on the "recognized hazard" allegation.

Complainant assumed the burden of proof of a complex and technical proposition. His witnesses, testifying in restrained terms from modest experience, impressed with their credibility and disinterest. But neither the collective force of their opinions nor the history of explosions and injuries which precipitated the OSHA inspection, is sufficient to establish the existence of a recognized hazard on October 19, 1976, in the face of unrebutted testimony that the disputed circuitry logic was commonly used in the industry.

Ironically, the fact that the investigating committee which recommended removal of the adjacent mill trip may have rightly focused on the cause of the explosion, is immaterial to the decision. However evident the danger may have later appeared to investigators, the proof herein failed to prove that the hazard was "recognized" within the meaning of section 5(a)(1) and the Citation must be vacated.

---

[4/] Pyron testified that tripping a loaded pulverizer is not a common practice, except in emergency conditions (T. 61). William Green and Earl Wayne Downs, two other witnesses with TVA experience, testified that TVA generating plants did not use an adjacent mill trip (T. 191, 210). However, no witness took issue with Drake's testimony that adjacent mill tripping is common to the Combustion Engineering standard system (T. 325).

## FINDINGS OF FACT

Having held a hearing and considered the entire record herein, it is concluded that a preponderance of the reliable, probative, and substantial evidence supports the findings of fact set forth in the foregoing summary of evidence.

## CONCLUSIONS OF LAW

1. At all times material hereto Respondent was an employer within the meaning of section 3 of the Occupational Safety and Health Act of 1970.

2. Jurisdiction of this proceedings is conferred upon the Occupational Safety and Health Review Commission by section 10(c) of the Act.

3. On or before October 19, 1976, Respondent did not violate section 5(a)(1) of the Act at its power generating plant worksite at 8700 Hawthorne Road, Kansas City, Missouri, as alleged in Item 1 of the Citation for serious violation issued to Respondent November 24, 1976, the evidence having failed to establish that tripping devices in the control circuits of the Unit No. 5 coal pulverizer which caused both the pulverizer and its associated exhaust to stop without purging and while charged with heated air and coal constituted a recognized hazard within the meaning of section 5(a)(1) of the Act.

## ORDER

Based on the above findings of fact and conclusions of law, it is ORDERED that the Citation for serious violation issued to Respondent

November 24, 1976, is hereby vacated.

Date: March 31, 1978

## NOTICE OF DECISION

Secretary of Labor v. William B. Hopke Company, Inc.
OSHRC Docket No. 81-206

1. Enclosed is a copy of my decision. It will be filed with the Commission on February 16, 1982, and will become the final order of the Commission on March 18, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is March 18, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Date: January 27, 1982

## DECISION AND ORDER

Sommer, Judge

On December 22, 1980, Respondent was issued serious Citation Number 1 alleging violation of 29 CFR 1926.201(a)(2)[1/] (wording later amended), willful Citation Number 2 alleging violation of 29 CFR 1926.652(k) (later amended to allege violations of 29 CFR 1926.652(k) and 1926.652(d))[2/] and nonserious

---

1/ Section 1926.201 Signaling provides:
(a) Flagmen (2) Signaling directions by flagmen shall conform to American National Standards Institute D 6.1-1971, Manual on Uniform Traffic Control Devices for Streets and Highways.

2/ Section 1926.652(k) Specific trenching requirements provides:
(k) Portable trench boxes or sliding trench shields may be used for the protection of personnel in lieu of a shoring system or sloping. Where such trench boxes or shields are used, they shall be designed, constructed, and maintained in a manner which will provide protection equal to or greater than the sheeting or shoring required for the trench.
Section 1926.652(d) provides:
(d) Materials used for sheeting and sheet piling, bracing, shoring, and underpinning, shall be in good serviceable condition, and timbers used shall be designed and installed so as to be effective to the bottom of the excavation.

Citation Number 3 for alleged violation of 29 CFR 1903.2(a)(1).[3/] A penalty of $10,000 was proposed for the willful citation, $400 for the serious citation, and no penalty for the nonserious citation, all of which are contested.

Hearings were held in Washington, D.C. Both parties were represented by counsel, who filed briefs at the conclusion of the case.

No jurisdictional issues are in dispute, the parties having pleaded sufficient facts to establish the Respondent is subject to the Act and the Commission has jurisdiction of the parties and of the subject matter.

The general issue to be determined is whether the Respondent violated the safety regulations as alleged in the citations and, if so, what penalty, if any, is appropriate.

## SUMMARY OF THE EVIDENCE

The Respondent corporation is engaged in the underground excavation business with its principle place of business being located in Alexandria, Virginia. It was engaged in installing a sanitary sewer system at the place of the alleged violations.

### Testimony on behalf of Complainant

The worksite was inspected by Clyde Farrar, Jr., the Secretary's Compliance Officer (C.O.), on December 12 and 15, 1980 (T. 29). There were nine employees working at the site. The C.O. spoke to the foreman, Norman Shaw, and then proceeded

---

3/ Section 1903.2 Posting of notice; availability of the Act, regulations and applicable standards provides:
(a)(1) Each employer shall post and keep posted a notice or notices, to be furnished by the Occupational Safety and Health Administration, U.S. Department of Labor, informing employees of the protections and obligations provided for in the Act, and that for assistance and information, including copies of the Act and of specific safety and health standards, employees should contact the employer or the nearest office of the Department of Labor. Such notice or notices shall be posted by the employer in each establishment in a conspicuous place or places where notices to employees are customarily posted. Each employer shall take steps to insure that such notices are not altered, defaced or covered by other material.

to the inspection. He noted an open trench about 35 feet long, with two trench boxes (also called trench shields) therein (T. 31, 32) each of which measure 8 feet in depth and 16 feet in length (T. 44), adjacent to each other. Both of them were estimated, when inserted in the trench, approximately 6 feet above the trench bottom (T. 44). Work was being done in both boxes (T. 33). The C.O. informed Mr. Shaw that additional protection to the bottom of the trench was needed, necessitating that the boxes extend to the bottom (T. 34, 35). Thereafter, Shaw had the backhoe push one of the trench boxes down further into the trench, with it finally resting approximately 3 feet 5 inches to 3 feet 10 inches above the bottom (T. 40). Pursuant to the C.O.'s request, Shaw had one of the employees working in the trench take a soil sample which the C.O. described as being very moist, reddish brown, with some white streaks. The sample was taken to the C.O.'s office and kept in a sealed plastic bag until August 13, 1981, when it was sent to the Bureau of Standards for analysis (T. 45, 46, 50). Referring to Table P-2 of the regulations (1926.652), and based on his visual and physical inspection of the soil, the C.O. characterized it as likely to crack (T. 51). He felt that additional protection could have been provided by using an additional trench box, sloping or shoring (T. 56, 57). At the closing conference held on December 15, 1980, a number of documents were obtained from the Respondent (C-8 through and including C-11 in evidence) relative to trenching procedures and standards issued by the Heavy Construction Contractors Association (T. 66). According to Farrar, the hazard presented was that men working in the trench could be killed or seriously hurt by a collapse of the unprotected bank (T. 70, 71).

He further recommended that a citation be issued because the flagman was using improper signalling procedures in that he was trying to stop traffic by waving the flag up and down or cracking it, instead or holding it in a stationary

position as is required. The C.O. saw construction trucks pulling out in front of traffic to stop it, and also observed the flagman attempting to stop the traffic similarly (T. 79-81). The hazard presented to both the flagman and other workers is injury on being struck by a vehicle under the circumstances (T. 82).

He recommended a citation be issued because of a violation of 1903.2(a)(1) because there were no OSHA notice posters posted as required at either the main office of the Respondent or at the worksite (T. 85-88).

Wade M. Keener, a public utilities inspector for the Fairfax County Department of Environmental Protection, first visited the Respondent's worksite on November 14, 1980 at which time a bore pit was in the process of being dug (T. 351). The pit was approximately 15 feet deep and for the three week period during which time he visited the site daily two trench shields, one on the top of the other were in place, and the lower shield went to the bottom of the excavation (T. 352). On either December 9 or 10, 1980, he became concerned about trench protection inasmuch as only one trench shield was being used leaving four to five feet unprotected at the bottom of the trench (T. 356-357). He spoke to Mr. Shaw to either lower the trench shield or add other protection at the bottom, and was told some corrective measures would be taken. However, none were taken on the following day. Keener called Wassell, the superintendent, and said there was a dangerous condition that should be checked. Thereafter he stated both Shaw and Wassell told him they felt that they were entitled to an area of five feet below the shield (T. 359-361). They thought it was a safe operation (T. 373). On cross examination Keener indicated his estimate of approximately four feet unprotected could be off six inches to a foot (T. 385). Keener indicated he had called OSHA to report his findings since he and the Respondent's superintendent disagreed as to the required depth of the shield (T. 394).

Felix Yokel, an employee of the National Bureau of Standards, a leader of the Geotechnical Engineering Group doing research in soil and foundations testified. Yokel has a PhD degree in structural engineering with a major in soil mechanics. Yokel examined the soil sample sent to him by Farrar and described it as a disturbed sample (taken crumbled) of clay silt with an average plasticity index. As it was a disturbed sample he was unable to get information on the sheer strength of the soil but only the particle size distribution (T. 429). Sheer strength was defined as its resistance to sliding (T. 429). Under Table P-2 of Section 1926.652 the condition of earth would be classified as "likely to crack" (T. 430). He was of the opinion that a trench box 3 feet 5 inches to 3 feet 10 inches above the ground is not as effective as shoring installed according to Table P-2 (T. 439). He stated that his group has recommended that if the regulations are revised, a two to three foot clearance be allowed in using trench boxes in any type of soil (T. 441).

Eugene L. Ellison, a compliance officer with the Virginia Department of Labor and Industry, testified that his department enforces the occupational safety and health regulations, and that they conform to the federal regulations, specifically they have adopted Section 1926 (T. 563). He conducted an inspection of a site where the Hopke Company was installing a sewer line on November 6, 1979, in response to information that an accident had occurred therein, which resulted in the death of one person from a trench cave-in (T. 570-574). One willful citation was issued against the Respondent because of alleged violation of Section 1926.652(a) due to improper sloping and no shoring (T. 578-579). A final order has not been issued as yet, but the Fairfax County Court has apparently characterized the citation as a serious one. At the time he made his inspection,

Paul Wassell, Joe Hopkins and later, Mr. Hopke were at the worksite (T. 574). Ellison has seen the Hopke Company use trench boxes effective to the bottom of the trench on three occasions at company worksites which complied with the standards (T. 609). His office accepts either a state or federal poster being posted as complying with the poster requirements, and that a review of the reports indicates they so complied in the past (C-23 in evidence, T. 600-601).

Gilbert L. Esparza, the Area Director for the Washington, D.C. area office of the Occupational Safety and Health Administration, testified that after discussing the matter with Farrar, the compliance officer, and with the information gotten from Keener, the Fairfax County employee who referred this matter, he concluded that a willful citation be issued herein (T. 620-621). The decision was based on such information, and that the Respondent "knew what the regulations were, that they knew what they should be doing to prevent cave-ins, at least they had been instructed to do so, and failed to do so" (T. 622).

William B. Hopke, Jr., the president of the Respondent, called as a government witness testified that the company has been in business 20 years (T. 624). He indicated that the company had purchased four trench boxes in 1979 or earlier (T. 632). He stated the company belongs to the National Utilities Contractors Association, and received documents from them relating to safety which were used (T. 626-627). Counsel for the Respondent stipulated that the Respondent was aware of the regulation involving trench boxes before the case began (T. 627). Hopke testified the soil at the worksite would be classified as moist soil (T. 635).

Norman Shaw, the Respondent's foreman testified there were nine employees on the site (T. 648-649). In looking at exhibit C-4 he testified the workman in the trench as Daniel Carter who he estimated was 5 feet 6 inches tall (T. 650-651). Shaw stated that the trench box was in the process of being lifted out and the dirt put in at the time the photograph (C-4) was taken.

Testimony on behalf of Respondent

Charles J. Kupper, Jr., a consulting engineer for thirty years testified that he consults for municipalities in doing the design as well as the construction management for utility work (T. 660). He is familiar with the installation of sewer lines, and has done design work therefore, been a resident engineer on such projects and inspected same (T. 663). He opined that "the bottom of the trench box never gets to the bottom of the trench" (T. 665), and is kept "two to three feet above the bottom of the trench at all times" (T. 665). This is so because of the configuration of the trench as it is excavated. He stated a trench box installed two to three feet above the bottom of a trench is effective to the bottom of the trench (T. 671).

Paul Wassell, the general superintendent for the Respondent, testified that after Keener called him he went and looked at the trench with Shaw, and both felt there were no unsafe conditions present. He thereafter told Keener the same thing. Keener felt the box should be to the bottom of the trench, and Wassell disagreed (T. 679-680). Wassell also spoke to Farrar, and was told that they could seek a variance to keep the trench box off the bottom (T. 681). He further stated Farrar did not discuss the flagman with him (T. 681-682).

Norman Shaw, the foreman, testified Farrar was present while pipe was being laid and the men were in the trench and did not indicate any violation present. He said Farrar had told him to go ahead and lay the pipe so that he could observe it (T. 704). Shaw was of the opinion that the operation was 100% safe (T. 726). Based on his experience he opined that trench boxes are more effective than shoring (T. 779). Other than telling him he'd rather have stop and slow signs instead of flags, Shaw stated Farrar did not say anything about the manner of their use (T. 779-780).

During his rebuttal testimony Yokel indicated there is a greater risk of cave-in where the trench box is 3 feet 9 inches from the bottom as opposed to 3 feet (T. 827).

Alleged Violation of 29 C.F.R. § 1926.652(k) and 29 C.F.R. § 1926.652(d) - Item Number 1, Citation Number 2

The gravamen of the violation under these sections is that the trench boxes (or shields) used by the Respondent were more than three feet above the trench bottom, and as such were ineffective to the bottom of the trench.

The Secretary contends that the trench boxes must be effective to the bottom of the trench, and interprets this as no more than two to three feet above the trench bottom.

The testimony of the government expert witness was that a trench box at such distance would be considered so effective, or to describe it further, would provide protection equal to or greater than the shoring required for the trench. The ultimate question which presents itself is whether the Secretary has sustained the burden of proof that the trench boxes were not within three feet of the bottom of the trench. The Secretary must do so by a preponderance of the evidence.[4/]

Applying this standard, the evidence as a whole demonstrates that the Secretary has not carried his burden. Granting the efficacy of the three foot rule as gleaned from the testimony of the Secretary's expert (Yokel), and the Respondent's expert (Kupper), the testimony of the witnesses for the Secretary which is of cardinal importance on this question of fact present a pattern of vagaries, inconsistencies and mere surmise which seriously challenge the credibility of the alleged findings.

---

4/ Section 7(c) of the Administrative Procedure Act establishes prepondrance of the evidence as the standard of proof. Steadman v. Securities and Exchange Commission, 101 S. Ct. 999 (February 25, 1981); Armor Elevator Company, Inc., 5 OSAHRC 260; 1 BNA 1409, 1973-4 CCH OSHD ¶ 16,958 (Nos. 425 & 426, 1973).

Farrar, the compliance officer and main government witness issued the citation herein on a theory wholly foreign to the purported position of the Secretary. He opined that effective to the bottom of the trench meant that the trench box had to go to the very bottom, and consistent with this erroneous conclusion issued such citation. Under this theory he did not bother to measure the distance from the bottom of the trench box at any time, but used either a visual measurement (at best a guess) or relied on someone else to give him a measurement (employee of Respondent). However, where he relied on another, he did not check the measurement, nor frankly know the capacity of the measurer's ability. It is noted that the government at no time called the party who allegedly did the measuring as a witness to verify his technique or his findings. Thusly, Farrar testified that when he visited the construction site on December 12, 1980, he found two trench boxes were six feet above the trench bottom, and that box #2 was pushed down by the Respondent to where it was approximately 3 feet 5 inches to 3 feet 10 inches from the bottom. As to box #1 and box #2 his initial finding of 6 feet was a mere estimate, or one could say speculation. However, his findings are contradicted by Shaw, the Respondent foreman who states the distance estimated by Farrar is erroneous and that trench box #1 was at the time reported being lifted out of the trench and was lower previously. Shaw is corrobrated in his statement by Keener, the Farifax County public utilities inspector who visited the construction site on the 12th of December and first estimated the trench box was approximately four feet from the bottom. (Indicating it was being raised as Shaw testified, and which Farrar was skeptical about.) Furthermore, to add to the confusing and contradicting statements, Keener opined that his four foot estimate could be incorrect by six to twelve inches plus or minus.

As to trench box #2, Farrar relies on the measurement taken by an employee of the Respondent. He did not verify it himself, and there is no way of knowing whether the measurement taken was from the very bottom of the trench box since the testimony reveals that a portion of the lower part of the box is embedded in the soil and cannot be seen. Hereto, although Farrar states he received a 3 feet 5 inches to 3 feet 10 inches measurement from the employee, he changes the purported finding during his testimony to "about three feet" above the bottom. In short, the testimony of Farrar as to the height of the trench boxes in relation to the bottom of the trench is far from convincing. We are faced with measurements of six feet, three feet ten inches, three feet five inches, and three feet. Surrounding all these estimations is their reliability as set forth previously. The violation of 29 C.F.R. § 1926.652(d) & (k) herein cannot be based on the shifting sands of the trench. The Secretary's reliance on mere conjecture is insufficient to prove a violation. Secretary v. Franklin Lumber Co., 2 OSAHRC 1078. As Judge Learned Hand stated in N.L.R.B. v. Remington Rand, 94 F.2d 862, 873 (2d Cir. 1938), cert. denied, 304 U.S. 576 (1938), 58 S. Ct. 1046, we must rely in making findings upon "the kind of evidence on which responsible persons are accustomed to rely in serious affairs." Such reliable testimony is lacking herein. The testimony presented by the Secretary is not sufficient to support a finding that Respondent violated the Act in that the trench boxes being used in the excavation herein were ineffective to the bottom of the trench. Upon review of the record and the circumstances embodied therein, I conclude that the violations charged of 29 C.F.R. 1926.652 (d) & (k) has not been established.[5/]

---

5/ In view of this holding it is unnecessary to decide the significance of counsel for Respondent's objection to the amendment of Citation Number 2 under the Federal Rules of Civil Procedure.

Alleged Violation of 29 C.F.R. 1926.201(a)(2) - Item Number 1, Citation Number 1

The Respondent was cited for a serious violation of 29 C.F.R. 1926.201(a)(2) in that it failed to conform to proper signaling directions as set forth in the American National Standards Institute D 6.1-1971, Manual on Uniform Traffic Control Devices for Streets and Highways. It is alleged that the flagman waved the flag in an up and down cracking manner instead of extending it horizontally in a stationary position.

Paragram 6E-4 Flagging Procedures which deals with methods of signalling is prefaced with the following: "The following methods of signaling with a flag should be used" (underlining added). Section 1A-4 meanings of "shall", "should" and "may" which is part of the Manual on Uniform Traffic Control Devices states "should" is an advisory condition, and where used "it is considered to be advisable usage, recommended but not mandatory." The Commission has ruled that standards adopted from advisory source standards are advisory under the Act. Brown & Root, Power Plant Division, 80 OSAHRC ____, 9 BNA OSHC 1027, 1029, 1980 CCH OSHD ¶ 24,958 at p. 30,795 (No. 76-2938). The cited standard being advisory, noncompliance cannot be the basis for finding a violation. General Electric Company, 9 BNA OSHC 1185, 1186 (1980). Accordingly, the citation alleging a serious violation of the Act for failure to comply with 29 C.F.R. 1926.201(a)(2) is vacated.

Alleged Violation of 29 C.F.R. 1903.2(a)(1) - Item Number 1, Citation Number 3

This concerns an alleged violation of the regulation at 29 C.F.R. 1903.2(a)(1) for Respondent's failure to post an OSHA notice at the job location herein. The uncontested evidence demonstrates that the Respondent did not exhibit the required poster at either its main office or at the location of the trench excavation.

It defends by alleging that it was never furnished such poster by the Occupational Safety and Health Administration as required. However, this allegation is contrary to the evidence. Exhibit C-24 in evidence are reports of the Virginia Department of Labor and Industry, Occupational Safety and Health which indicate that on previous occupational safety and health examinations the Respondent was found to be complying with the posting requirement. On five such previous examinations the question, "Does employer comply with posting requirements?" was answered "Yes". The state of Virginia carries out and complies with similar requirements of the Occupational Safety and Health Act. It is apparent that the Respondent knew of such posting requirement, and had in fact previously been in possession thereof, since it posted same. Accordingly, this violation is affirmed. No penalty is assessed.

## Findings of Fact

1. William B. Hopke Company, Inc. is a corporation with a principle place of business located in Alexandria, Virginia. The Respondent was engaged in the business of installing a sanitary sewer system at the place of the alleged violation.

2. On December 12 and December 15, 1980, a compliance officer of the Occupational Safety and Health Administration, inspected the Respondent's workplace located at Ravensworth Road and Kalorama Road in Annandale, Virginia.

3. The Respondent acknowledges it is engaged in interstate commerce.

4. The evidence of record is insufficient to support a finding that any of the trench boxes or trench shields used by the Respondent in the excavation at the site mentioned were ineffective to the bottom of the trench at the site of the excavation in this matter.

5. The Respondent was cited for violating 29 C.F.R. 1926.201(a)(2) in that it failed to use proper signaling directions.

6. Said regulation is derived from the American National Standards Institute D 6.1-1971, Manual on Uniform Control Devices for Streets and Highways.

7. Said described manual instructions regarding signaling are advisory in character.

8. Noncompliance with that provision cannot be the basis for finding a violation of Section 5(a)(2) of the Act.

9. 29 C.F.R. 1903.2(a)(1) requires the Respondent to post an Occupational Safety and Health Administration notice at the job location herein.

10. The Respondent did not post such notice as required, although it knew of such requirement, having done such posting previously.

## Conclusions of Law

1. The Respondent was at all times herein in a business affecting interstate commerce within the meaning of Section 3(5) of the Occupational Safety and Health Act of 1970.

2. The Occupational Safety and Health Review Commission has jurisdiction over the subject matter and parties to this action.

3. Respondent was not in violation of 29 C.F.R. 1926.652(d) and 29 C.F.R. 1926.652(k).

4. Respondent was not in violation of 29 C.F.R. 1926.201(a)(2).

5. Respondent violated 29 U.S.C. 654(a)(2) by failing to comply with 29 C.F.R. 1903.2(a)(1).

## ORDER

Upon the basis of the foregoing findings of fact and conclusions of law, and upon the entire record, it is ORDERED that

1. Item 1 of serious Citation Number 1 is vacated.

2. Item 1 of willful Citation Number 2 is vacated.

3. Item 1 of other than serious Citation Number 3 is affirmed, and no penalty is assessed.

IRVING SOMMER
Judge, OSHRC

Dated: February 16, 1982
Washington, D.C.

UNITED STATES OF AMERICA

**OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION**

1515 Broadway
New York, New York 10036

NOTICE OF DECISION

Secretary of Labor v. Thomas A. Armbruster, Inc.
OSHRC Docket No. 81-1907

1. Enclosed is a copy of my decision. It will be filed with the Commission on February 16, 1982, and will become the final order of the Commission on March 18, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is March 18, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

## DECISION AND ORDER

Fier, Judge:

## PRELIMINARY STATEMENT

This is a proceeding pursuant to section 659 of the Occupational Safety and Health Act of 1970 (29 U.S.C. § 651 *et seq.*), hereinafter called the Act, wherein the Respondent contests the citation and penalty for one serious violation and

one other violation. The citation dated July 21, 1981, was based on an inspection conducted June 24, 1981 through June 26, 1981. The citations and proposed penalties were issued pursuant to sections 9(a) and 10(a) of the Act.

Pursuant to section 10(c) of the Act (29 U.S.C. § 659(c)) Respondent, through a letter received August 5 , 1981 noted its timely contest of the violations and proposed penalties.

## I S S U E S

1. Whether the Respondent violated the Occupational Safety and Health Act as alleged.

2. Whether the Respondent failed to comply with 29 CFR 1926.652(c) listed as a serious violation and 29 CFR 1926. 500(e)(1)(iii) a non serious violation; if so, did it violate 29 CFR U.S.C. § 654(a) of the Act.

3. If the Respondent is shown to have violated the Act as alleged, what if any penalties, are appropriate.

The standards said to have been violated allege:

Serious Violation:

> 29 CFR 1926.652(c): The side(s) of the trench(es) in hard or compact soil, including embankment(s), were not shored or otherwise supported when the trench was 5 feet or more in depth and 8 feet or more in length:
>
> (a) A trench from 6 feet to 7 feet deep running north and south at the west end of the north wing of the Laboratory was not shored, benched or sloped to protect 2 employees from cave-in, June 25, 1981.

A penalty of $360.00 was proposed.

Other Violation:

29 CFR 1926.500(e)(1)(iii): One stair railing not provided on each side of stairway(s) less than 44 inches wide, having both sides open:

(a) The 40 inch wide 6 riser access stairs to a storage trailer in the Job Trailer Lot on the east side of the Administration Building were not equipped with a stair railing on the right side ascending to protect against a fall of 54 inches June 25, 1981.

No penalty was proposed.

SUMMARY OF EVIDENCE AND STIPULATION

Prior to the commencement of the trial, the parties stipulated that citation number 2 in the Kospiah case, docket number 81-2000, and citation number 2 in the Armbruster case, docket number 81-1907, were not to be contested and will not be tried in this matter. Accordingly, they will be affirmed as stated in the citations. The admissions submitted by the Respondent to the Secretary were received into evidence by stipulation. The parties stipulated that there would be one trial combining both cases, but there would be separate decisions*(T-47).

The summary of testimony shows that the compliance officer, Leon A. Robertson, has been a compliance officer for eight years (T-10). He has made 550 inspections, 60% of which were construction sites(T-10). On June 25, 1981, he made an inspection of the sites in issue. The compliance officer observed that on arriving at the worksite, he saw a man in a trench, the height of which

* Denotes transcript page number.

was well above the man's head(T-11). Exhibit C-1 shows that the depth measured was larger than the standard permitted(T-12). He noted that the employee was using a jackhammer(T-13). The trench was six to seven feet deep, approximately eight feet wide at the top and four feet at the bottom. It was also approximately twenty feet long(T-12).

Mr. Race, the other compliance officer, made the measurements. Exhibit C-1 was marked with an "x" where measurements were taken, indicating that the depth of the trench was seven feet(T-12). This constituted a violation of the standard set forth in the citation, according to the compliance officer, and as such, a citation was issued. He also observed no shoring on the east wall and noted that it was not sloped. The soil was described as being compact clay-stone and was described as being "hard and compact"(T-14). The compliance officer stated that with regard to direction, he asked someone which direction was north and relying on the answer that was given to him, he then used the descriptions set forth in Exhibit C-3 and also in his testimony(T-39). The compliance officer testified that Leon Wagner, an employee of Kospiah was breaking rock in the trench with the use of the jackhammer(T-14). Mr. Kospiah was with the compliance officer at the time of the inspection. They met at the trench. The compliance officer told the Respondent that the trench should be shored, benched, or sloped (T-16). Mr. Kospiah said he would do this immediately and the compliance officer noted that the abatement started before they left the scene of the excavation(T-16). The hazard was serious

because the vibration of the jackhammer could cause a cave-in (T-16). It was also noted that the soil bank in Exhibit C-1 by the initials SB, also showed a hazard(T-17). The tractor, while not running at the time of the inspection, was said to be a contributor to the hazard of a cave-in(T-18). The injuries, in the event of a cave-in, could be serious or result in death (T-18). Other employees were observed in the trench at the north end(T-18). This is described in the sketch marked as Exhibit C-3. The sketch was prepared at the site in a rough manner and was completed when the compliance officer returned to the office(T-19). Respondent alleges that the sketch is not to scale(T-21).

The Armbruster employees were in the trench in the northwest corner and were using a ruler to take certain measurements (T-25). It is stated that they were preparing to build forms. The compliance officer indicated that he spoke to Mr. Shueck after he came out of the trench who said he was an Armbruster employee(T-25). The width at the bottom was said to be four feet and the depth of the trench was said to be seven feet(T26). The area where the depth was measured is indicated in Exhibit C-2 by a circle with an "x". It is stated that the depth was described as being seven feet deep(T-26). The length of the trench was given as twenty feet. The banks in the southeast area of the sketch were sloped back and benched. A letter U was marked on the photograph to show where undercutting was observed(T-28). The soil was similar to other soil in the

trench described as compact(T-28). The same hazards were observed, mainly a cave-in which could result in serious injury or death. With regard to the penalties in the Kospiah case, the citation recommendation was reduced by using the field operation manual adjustment factors, namely, size being approximately twenty employees, resulted in a reduction of 30%. Good faith resulted in a reduction of 20% because the Respondent was described as very cooperative and abated immediately. History was adjusted by 10% because the Respondent was a new employer with less than one year in business. This resulted in a total reduction of 60% from the unadjusted proposed penalty(T-30).

As to Armbruster, the same basic rules were observed, except that the Respondent had 100 employees at the time, resulting in a 10% reduction for size. Good faith initiated a reduction of 20%. A reduction of 10% was granted for history, resulting in a total 40% reduction(T-31,32).

On cross-examination, counsel for the Respondent showed that in the bottom of the photo (Exhibit C-1) and in the middle of the photo, there is a "bench" not shown on the diagram (Exhibit C-3). It is stated that the diagram shows "benching" on the east side(T-33). The attorney brought out that the orientation of the sketch was incorrect. The width of the trench in Exhibit C-1 was described as four feet, and the tools in Exhibit C-1 show that the shovel was resting against a wall with no bench (T-37). It is stated that there is a bench on the opposite side. The line at the base of C-1 indicates approximately a four-foot

width. Mr. Witczak was with the compliance officer at the time of the inspection. An X with a circle around it (Exhibit C-2) indicates the depth of the trench as being seven feet from the mark of the X in the circle to the shoe of the man in the T-shirt (T-40). The compliance officer testified there was no sloping in the trench(T-40). The man in the blue shirt, of Exhibit C-2, was an Armbruster employee and identified as such(T-41). On the day of the inspection, the compliance officer said there was a rain shower prior to the inspection, but it did not result in much dampening of the soil(T-41). The white or gray color in C-1 is described as stone dust(T-45,46). Mr. Race made the measurement to the bottom of the trench by extending his arm out fully,and dropping the steel tape beyond the bench, resulting in a seven-foot measurement(T-41,42,46).

Mr. Eugene Kospiah testified that he has been in the excavation business since January 17, 1981(T-49). He is president of the corporation and he does utility and excavation work(T-49). On June 25, 1981, he was doing excavation work and described the soil as virgin soil. Exhibit C-1 shows a Kospiah employee, Leon Wagner. Exhibit C-2 is described as showing Armbruster employees (T-52). Exhibit C-3, the witness testified, is incorrect because the orientation should be corrected to show that north is actually west, south is actually north and west is actually south(T-53). In Exhibit C-1, the X measured by Mr. Race is said to be incorrect (T-54). The correct place where the measurement was taken is said to be where the shovel is shown in the photograph. The manner

used in taking the measurement is also said to be an incorrect measurement(T-55). As to Exhibit C-1, the soil pile, the condition of the soil on the prior day indicated that the trench had a full "bench"(T-57). On the morning of the inspection, the jackhammer was brought into operation to remove some rock. At the time of the removal of the rock, the depth was actually five foot nine inches, according to scale noted in Exhibit R-3 (R-3). When the rock was removed, the excavation did not go below grade. The witness did concede that the rock was large.

Exhibit R-1 is a plan showing the trench mark with a zero(T-59). The "f.e." is used to describe the finished elevation as 419 feet. "C.E."is described as the concrete elevation (T-62). It is stated that prior to the inspection, the witness checked the excavation and noted that they conformed to the plan, Exhibit R-1. The measurements were confirmed by Mr. Witczak and the Air Products Corporation representative. The witness has been in the excavation business for more than 28 years. He does not believe that there was any safety hazard. He believes there was no danger of collapse. The Respondent has a safety program which includes weekly meetings because it is a requirement of Turner Construction(T-72). Since the Respondent is an excavator, most meetings are concerned with safety. Immediately after the picture was taken by the compliance officer, the employees were removed from the trench and trenching and sloping were increased. As to Exhibit C-1, the depth where the employee was working was

said to be five foot nine inches. The photograph is deceptive causing the depth to appear much deeper than it actually is. Exhibit C-2, marking (circle with an X), testimony alleges that the measurement was not taken at the marking but was actually taken from the same side where the photo was taken, namely the bottom of the photo. Exhibit C-3, the depth was stated to be five foot nine inches; this would also apply to Exhibit C-2 where an X is marked on the photo. The soil was dry that day, minimizing the danger of a cave-in. On cross-examination, the witness testified that Mr. Wagner is five foot nine inches tall (T-68). In Exhibit C-2 the employees are Armbruster employees. The Respondent did not make any measurements but observed Mr. Race. The Respondent did not take issue with the announced measurements, which were called out by Mr. Race to Mr. Robertson. The five foot nine inches depth is said to be the depth when the excavation is finished but it is alleged that the excavation was below grade. This was said to be necessary because the rock which was said to be a large rock which could not be removed by the back hoe because it was too big.

Mr. James Witczak, an Armbruster employee, states that he has been a construction superintendent for 12 years(T-73). His duties include safety. On the date of the inspection, June 25, 1981, he was at the site within one-half hour before the inspection(T-74). He did not see any change in the configuration at the time or after the inspection(T-75). The trench had a slope

and conformed with the angle required. The Respondent's witness submitted Exhibit R-2, which is a copy of table P-1, showing the angle of repose required by the standard(T-75). The excavation slopes shown in Exhibits C-1 and C-2 were tapered just a little bit less than 50 degrees in comparison to the 63 degrees in the table(T-76). In Exhibit C-2, Richard Moore, a carpenter steward, had the responsibility for safety compliance(T-77). The Respondent has a safey program and holds regular meetings(T-78). The employees attend the safety meetings(T-78). The Respondent was on the work-site approximately three weeks prior to the time of inspection. Prior to the date of inspection, the employees did not work in this particular trench. Mr. Shueck is said to be six feet tall (the man in the white T-shirt in Exhibit C-2)(T-79). Employees are instructed to take measurements to verify the excavations to comply with the specifications noted in R-1. The witness did not take any measurements on the day of inspection. The slope is said to be an estimate. Some trench areas sloped more, and some less, than 60 degrees.

In the closing statement, the Secretary alleges that the trench was more than five feet deep and that it was actually six to seven feet deep. The Respondent took no measurements but relied on the chart for the exact angle, although the measurement was not taken on the day of the inspection(T-81). The inspection shows that the trench is deeper than five feet and that the angle of repose is less than required by the standard. When a trench is finished, it is conceded that it

would be five feet nine inches. However, when the trench was inspected on June 25, 1981, the Respondent did not measure it. The compliance officer said he did. The Respondent asserts that the pictures speak for themselves. It conflicts with Exhibit R-1. The site plan is said to be better evidence than the photographs. The directions given on the sketch were said to be incorrect and therefore are inaccurate. It is also alleged that if a comparison is made of C-3 and R-2, the discrepencies will be evident.

## O P I N I O N

There is one remaining issue in this case. The issue is concerned with 29 CFR 1926.652(c); this relates to the depth of a trench which was inspected by the compliance officer and which is alleged to be deeper than permitted by the standard without shoring or a sufficient angle of repose. The issue is a question of fact and based on the evidence submitted, it would appear that reliance is given to the testimony of the compliance officer who allegedly took measurements which showed that the depth of the trench was between 6 and 7 feet. The compliance officer also offered 2 photographs which appeared to show that the depth of the trench exceeded that which is above the height of the 2 workers who are described as being 5'9" and approximately 6'(T-68,79). The Respondent offered no proof as to measurements taken but merely surmised the depth of the trench from a view of the photographs (Exhibits C-1,C-2) and by also relying on the chart which was offered as showing the elevations in the foundation

plan (Exhibit R-1).

The Secretary alleges that the offer of proof in its case is based on measurements which were specifically taken to show that the depth of the trench exceeded that permitted by the standard. However, the compliance officer stated he did not take the measurements and did not see the tape measure touch the bottom of the trench(T-41,42). While it is not questioned that the depth of the trench may have exceeded the amount specified in the standard, nevertheless Exhibit C-1 does show that there is a bench in the trench and on the right side of the photograph there is evidence that there is an angle of repose which could easily have exceeded that required by the standard. The trench measured four feet at the base and eight feet at the top(T-12). The slope is said to be 50 to 63 degrees(T-80). Accordingly, from the evidence and the testimony, it is necessary to conclude that while the trench did not have shoring, there is evidence that the trench was benched, and was also sufficiently widened as the elevation of the trench rose to the top so that the angle of repose was sufficient to provide a safe working area for the workers involved. The Secretary has failed to carry its burden of proof. Accordingly, the violations in the Armbruster case and in the Kospiah case should be vacated.

## FINDINGS OF FACT

1. The credible evidence and the record as a whole, establishes preponderant proof of the following facts:

1. The Respondent, Thomas A. Armbruster, Inc., maintains and is involved in a business that uses materials and equipment which are within the jurisdiction of the Act.

2. The trench excavation, which is the basis for the citation, had a depth of 6 to 7 feet.

3. The evidence shows that the excavation also had a bench with a width of sufficient proportions to obviate the necessity for shoring.

4. The evidence of record shows that the right side of the trench, as shown in Exhibits C-1, C-2 and R-1, contained a sufficient angle of repose to provide a margin of safety to the workers in the excavation.

## CONCLUSIONS OF LAW

1. The Respondent is and was at all times engaged in a business affecting commerce within the meaning of Section 3(5) of the Occupational Safety and Health Act of 1970.

2. The Occupational Safety and Health Review Commission has jurisdiction over the subject matter and parties to this action.

3. The Respondent did not violate 29 CFR U.S.C. 654(a)(1) by failing to provide shoring in a trench excavation inasmuch as the trench did not contain benching and also a sufficient angle of repose.

## O R D E R

Upon the basis of the foregoing findings of fact and conclusions of law and upon the entire record, it is hereby ORDERED that:

1. Citation No. 1 is vacated.

2. Citation No. 2 concerning 29 CFR 1926.500(e)(1)(iii) which was not contested and stipulated is affirmed. No penalty is assessed.

## NOTICE OF DECISION

Secretary of Labor v. Kospiah Excavating, Inc.
OSHRC Docket No. 81-2000

1. Enclosed is a copy of my decision. It will be filed with the Commission on February 16, 1982, and will become the final order of the Commission on March 18, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is March 18, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

DECISION AND ORDER

Fier, Judge:

## PRELIMINARY STATEMENT

This is a proceeding pursuant to section 659 of the Occupational Safety and Health Act of 1970 (29 U.S.C. § 651 et seq.), hereinafter called the Act, wherein the Respondent contests the citation and penalty for one serious violation and one other violation. The citation dated July 21, 1981, was based on an inspection conducted June 24, 1981 through June 26, 1981. The citations and proposed penalties were issued pursuant to sections 9(a) and 10(a) of the Act.

Pursuant to section 10(c) of the Act (29 U.S.C. § 659(c)), Respondent, through a letter received August 11, 1981, noted its timely contest of the violations and proposed penalties.

## ISSUES

1. Whether the Respondent violated the Occupational Safety and Health Act as alleged.

2. Whether the Respondent failed to comply with 29 CFR 1926.652(c), listed as a serious violation, and 29 CFR 1926.28(a), a nonserious violation; and if so, did it violate 29 U.S.C. § 654(a) of the Act.

3. If the Respondent is shown to have violated the Act as alleged, what if any penalties, are appropriate.

The standards said to have been violated allege:

SERIOUS VIOLATION

29 CFR 1926.652(c): The side(s) of the trench(es) in hard or compact soil, including embankment(s), were not shored or otherwise supported when the trench was 5 feet or more in depth and 8 feet or more in length:

> (a) A trench from 6 feet to 7 feet running north and south at the west end of the north wing of the Laboratory was not shored, benched or sloped to protect against cave-in, June 25, 1981.

A penalty of $240.00 was proposed.

OTHER VIOLATION

29 CFR 1926.28(a): Appropriate personal protective equipment was not worn by employee(s) in all operations where there was exposure to hazardous conditions:

> (a) An employee operating a Wacker Earth Tamper (Model GUP150Y, Serial Number 233403566) at the center of the west wing of the Laboratory was not wearing foot protection to protect against foot injury, June 25, 1981.

No penalty was proposed.

SUMMARY OF EVIDENCE AND STIPULATION

Prior to the commencement of the trial, the parties stipulated that citation number 2 in the Kospiah case, docket number 81-2000, and citation number 2 in the Armbruster case, docket number 81-1907, were not to be contested and will not be tried in this matter. Accordingly, they will be affirmed as stated in the citations.
The admissions submitted by the Respondent to the Secretary were received into evidence by stipulation. The parties stipulated that there would be one trial combining both cases, but there would be separate decisions *(T-4-7).

The summary of testimony shows that the Compliance Officer, Leon A. Robertson, has been a compliance officer for eight years (T-10). He has made 550 inspections, 60% of which were construction sites (T-10). On June 25, 1981, he made an inspection of the site in issue. The CO observed that on arriving at the worksite, he saw a man in a trench, the height of which was well above the man's head (T-11). Exhibit C-1 shows that the depth measured was larger than the standard permitted (T-12). He noted that the employee was using a jackhammer (T-13). The trench was six to seven feet deep, approximately eight feet wide at the top and four feet at the bottom. It was also approximately twenty feet long (T-12).

---

*Denotes transcript page number

Mr. Race, the other Compliance Officer, made the measurements. Exhibit C-1 was marked with an "x" where measurements were taken, indicating that the depth of the trench was seven feet (T-12). This constituted a violation of the standard set forth in the citation, according to the compliance officer, and as such, a citation was issued. He also observed no shoring on the east wall and noted that it was not sloped. The soil was described as being compact clay-stone and was described as being "hard and compact" (T-14). The CO stated that with regard to direction, he asked someone which direction was north and relying on the answer that was given to him, he then used the descriptions set forth in exhibit C-3 and also in his testimony (T-39). The CO testified that Leon Wagner, an employee of Kospiah was breaking rock in the trench with the use of the jack-hammer (T-14). Mr. Kospiah was with the CO at the time of the inspection. They met at the trench. The CO told the Respondent that the trench should be shored, benched, or sloped (T-16). Mr. Kospiah said he would do this immediately and the CO noted that the abatement started before they left the scene of the excavation (T-16). The hazard was serious because the vibration of the jackhammer could cause a cave-in (T-16). It was also noted that the soil bank in exhibit C-1 by the initials SB, also showed a hazard (T-17).

The tractor, while not running at the time of the inspection, was said to be a contributor to the hazard of a cave-in (T-18). The injuries, in the event of a cave-in, could be serious or result in death (T-18). Other employees were observed in the trench at the north end (T-18). This is described in the sketch marked as exhibit C-3. The sketch was prepared at the site in a rough manner and was completed when the CO returned to the office (T-19). Respondent alleges that the sketch is not to scale (T-21).

The Armbruster employees were in the trench in the northwest corner and were using a ruler to take certain measurements (T-25). It is stated that they were preparing to build forms. The CO indicated that he spoke to Mr. Shueck after he came out of the trench, who said he was an Armbruster employee (T-25). The width at the bottom was said to be four feet and the depth of the trench was said to be seven feet (T-26). The area where the depth was measured is indicated in exhibit C-2 by a circle with an "x". It is stated that the depth was described as being seven feet deep (T-26). The length of the trench was given as twenty-feet. The banks in the southeast area of the sketch were sloped back and benched. A letter U was marked on the photograph to show where undercutting was observed (T-28). The soil was

similar to other soil in the trench described as compact (T-28). The same hazards were observed, mainly a cave-in which could result in serious injury or death. With regard to the penalties in the Kospiah case, the citation recommendation was reduced by using the field operation manual adjustment factors, namely, size being approximately twenty employees, resulted in a reduction of 30%. Good faith resulted in a reduction of 20% because the Respondent was described as very cooperative and abated immediately. History was adjusted by 10% because the Respondent was a new employer with less than one year in business. This resulted in a total reduction of 60% from the unadjusted proposed penalty (T-30).

As to Armbruster, the same basic rules were observed, except that the Respondent had 100 employees at the time, resulting in a 10% reduction for size. Good faith initiated a reduction of 20%. A reduction of 10% was granted for history, resulting in a total 40% reduction (T-31,32).

On cross-examination, counsel for the Respondent showed that in the bottom of the photo (Exhibit C-1) and in the middle of the photo, there is a "bench" not shown on the diagram (Exhibit C-3). It is stated that the diagram shows "benching" on the east side (T-33). The attorney brought out that the orientation of the sketch

was incorrect. The width of the trench in exhibit C-1 was described as four feet, and the tools in exhibit C-1 show that the shovel was resting against a wall with no bench (T-37). It is stated that there is a bench on the opposite side. The line at the base of C-1 indicates approximately a four-foot width. Mr. Witczak was with the CO at the time of the inspection. An "x" with a circle around it (Exhibit C-2), indicates the depth of the trench as being seven feet from the mark of the "x" in the circle to the shoe of the man in the T-shirt (T-40). The CO testified there was no sloping in the trench (T-40). The man in the blue shirt, in exhibit C-2, was an Armbruster employee and identified as such (T-41). On the day of the inspection, the CO said there was a rain shower prior to the inspection, but it did not result in much dampening of the soil (T-41). The white or gray color in C-1 is described as stone dust (T-45-46). Mr. Race made the measurement to the bottom of the trench by extending his arm out fully and dropping the steel tape beyond the bench, resulting in a seven-foot measurement (T-41-42,46).

Mr. Eugene Kospiah testified that he has been in the excavation business since January 17, 1981 (T-49). He is the President of the corporation and he does utility and excavation work (T-49). On June 25, 1981, he was doing excavation work and described the soil as virgin soil.

Exhibit C-1 shows a Kospiah employee, Leon Wagner. Exhibit C-2 is described as showing Armbruster employees (T-52). Exhibit C-3, the witness testified, is incorrect because the orientation should be corrected to show that north is actually west, south is actually east, east is actually north and west is actually south (T-53). In exhibit C-1, the "x" measured by Mr. Race is said to be incorrect (T-54). The correct place where the measurement was taken is said to be where the shovel is shown in the photograph. The manner used in taking the measurement is also said to be an incorrect measurement (T-55). As to C-1, the soil pile, the condition of the soil on the prior day indicated that the trench had a full "bench" (T-57). On the morning of the day of inspection, the jackhammer was brought into operation to remove some rock. At the time of the removal of the rock, the depth was actually five foot nine inches, according to scale noted in exhibit R-3 (T-58). When the rock was removed, the excavation did not go below grade. The witness did concede that the rock was large. Exhibit R-1 is a plan showing the trench mark with a zero (T-59). The "f.e." is used to describe the finished elevation as 419 feet. "C.E." is described as the concrete elevation (T-62). It is stated that prior to the inspection, the witness checked the excavation and noted that they conformed to the plan (Exhibit R-1). The

measurements were confirmed by Mr. Witczak and the Air Products Corporation representative. The witness has been in the excavation business for more than 28 years. He does not believe that there was any safety hazard. He believes there was no danger of collapse. The Respondent has a safety program which includes weekly meetings because it is a requirement of Turner construction (T-72). Since the Respondent is an excavator, most meetings are concerned with safety. Immediately after the picture was taken by the CO, the employees were removed from the trench and trenching and sloping were increased. As to exhibit C-1, the depth where the employee was working was said to be five feet nine inches. The photograph is deceptive, causing the depth to appear much deeper than it actually is. Exhibit C-2, marking (circle with an "x"), testimony alleges that the measurement was not taken at the marking but was actually taken from the same side where the photo was taken, namely the bottom of the photo. Exhibit C-3, the depth was stated to be five foot nine inches; this would also apply to C-2 where an "x" is marked on the photo. The soil was dry that day, minimizing the danger of a cave-in. On cross-examination, the witness testified that Mr. Wagner is five foot nine inches tall (T-68). In exhibit C-2

the employees are Armbruster employees. The Respondent did not make any measurements but observed Mr. Race. The Respondent did not take issue with the announced measurements, which were called out by Mr. Race to Mr. Robertson. The five foot nine inches depth is said to be the depth when the excavation is finished but it is alleged that the excavation was below grade. This was said to be necessary because the rock which was said to be a large rock which could not be removed by the backhoe because it was too big.

Mr. James Witczak, an Armbruster employee, states that he has been a construction superintendent for 12 years (T-73). His duties include safety. On the date of inspection, June 25, 1981, he was at the site within one-half hour before the inspection (T-74). He did not see any change in the configuration at the time or after the inspection (T-75). The trench had a slope and conformed with the angle required. The Respondent's witness submitted exhibit R-2, which is a copy of table P-1, showing the angle of repose required by the standard (T-75). The excavation slopes shown in exhibits C-1 and C-2 were tapered just a little bit less than 50 degrees in comparison to the 63 degrees in the table (T-76). In exhibit C-2, Richard Moore, a carpenter steward, had the responsibility for safety compliance (T-77). The

Respondent has a safety program and holds regular meetings (T-78). The employees attend the safety meetings (T-78). The Respondent was on the worksite approximately three weeks prior to the time of inspection. Prior to the date of inspection, the employees did not work in this particular trench. Mr. Shueck is said to be six feet tall (the man in the white T-shirt in Exhibit C-2 (T-79). Employees are instructed to take measurements to verify the excavations to comply with the specifications noted in R-1. The witness did not take any measurements on the day of inspection. The slope is said to be an estimate. Some trench areas sloped more, and some less, than 60 degrees.

In the closing statement, the Secretary alleges that the trench was more than five feet deep and that it was actually six to seven feet deep. The Respondent took no measurements but relied on the chart for the exact angle, although the measurement was not taken on the day of the inspection (T-81). The inspection shows that the trench is deeper than five feet and that the angle of repose is less than required by the standard. When a trench is finished, it is conceded that it would be five feet nine inches. However, when the trench was inspected on June 25, 1981, the Respondent admittedly did not measure it. The CO said he did. The Respondent

asserts that the pictures speak for themselves. It conflicts with exhibit R-1. The site plan is said to be better evidence than the photographs. The directions given on the sketch were said to be incorrect and therefore are inaccurate. It is also alleged that if a comparison is made of C-3 and R-2, the discrepencies will be evident.

OPINION

There is one remaining issue in this case. The issue is concerned with 29 CFR 1926.652(c); this relates to the depth of a trench which was inspected by the CO* and which is alleged to be deeper than permitted by the standard without shoring or a sufficient angle of repose. The issue is a question of fact and based on the evidence submitted, it would appear that reliance is given to the testimony of the CO who allegedly took measurements which showed that the depth of the trench was between six and seven feet. The CO also offered two photographs which appeared to show that the depth of the trench exceeded that which is above the height of the two workers who are described as being 5'9" and approximately 6' (Tr. 68,79). The Respondent offered no proof as to measurements taken but merely surmised the depth of the trench from a view of the photographs and also by relying on the chart which was offered as showing the elevations in the foundation plan (Exh. R-1).

---

*Denotes Compliance Officer

The Secretary alleges that the offer of proof in its case is based on measurements which were specifically taken to show that the depth of the trench exceeded that permitted by the standard. However, the CO stated he did not take the measurements and did not see the tape measure touch the bottom of the trench (T-41,42). While it is not questioned that the depth of the trench may have exceeded the amount specified in the standard, nevertheless exhibit C-1 does show that there is a bench in the trench and on the right side of the photograph there is evidence that there is an angle of repose which could easily have exceeded that required by the standard. The trench measured four feet at the base and eight feet at the top (T-12). The slope is said to be 50 to 63 degrees (T-80). Accordingly, from the evidence and the testimony, it is necessary to conclude that while the trench did not have shoring, there is evidence that the trench was benched, and also was sufficiently widened as the elevation of the trench rose to the top so that the angle of repose was sufficient to provide a safe working area for the workers involved. The Secretary has failed to carry its burden of proof. Accordingly, the violations in the Armbruster case and in the Kospiah case should be vacated.

## FINDINGS OF FACT

The credible evidence and the record as a whole, establishes preponderant proof of the following facts.

1. The Respondent, Kospiah Excavating, Inc., maintains and is involved in the excavating business and uses materials and equipment which are within the jurisdiction of the Act.

2. The excavation, which is the basis for the citation, had a depth of six to seven feet.

3. The evidence shows that the excavation also had a bench with a width of sufficient proportions to obviate the necessity for shoring.

4. The evidence of record shows that the right side of the trench, as shown in exhibit C-1, contained a sufficient angle of repose to provide a margin of safety to the workers in the excavation.

## CONCLUSIONS OF LAW

1. The Respondent is and was at all times engaged in a business affecting commerce within the meaning of Section 3(5) of the Occupational Safety and Health Act of 1970.

2. The Occupational Safety and Health Review Commission has jurisdiction over the subject matter and parties to this action.

3. The Respondent did not violate 29 CFR U.S.C. 654(a)(1) by failing to provide shoring in a trench excavation inasmuch as the trench did contain benching and also a sufficient angle of repose.

ORDER

Upon the basis of the foregoing findings of fact and conclusions of law and upon the entire record, it is hereby ORDERED that:

1. Citation No. 1 is vacated.

2. Citation No. 2 concerning 29 CFR 1926.28(a) which was not contested and stipulated is affirmed. No penalty is assessed.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

NOTICE OF DECISION

Secretary v. R. C. Diving Co., Inc.
OSHRC Docket No. 77-4487

Enclosed is a copy of my decision in the above-entitled case. This decision constitutes my final disposition of the proceeding pursuant to 29 U.S.C. §661(i) and 5 U.S.C. §557. I have this date mailed the original decision together with the Commission's file, transcript of testimony, and all exhibits to Richard Shiffmann, Chief Review Counsel, at the Commission's Office in Washington, D.C.

I am required to advise you as follows:

(1) The decision will be filed with the Commission on February 17, 1982 and will become the final order of the Commission on March 19, 1982 unless a member of the Commission directs that it be reviewed. Parties will not receive any further communications from the Commission unless the decision is directed for review. (See paragraphs 4, 5, and 6 below.)

(2) You may petition for discretionary review of this decision by the Commission. An original and three copies of such a petition must be submitted in accordance with 29 CFR 2200.91. The last day the Commission may consider your petition is March 19, 1982, the final order date. This final order date is set by law and cannot be extended.

(3) Petitions for review should be mailed to:

Richard Shiffmann, Chief Review Counsel
Occupational Safety & Health Review Commission
1825 K Street, N.W.
Washington, D.C. 20006

(4) Should review be ordered, each party will be notified and given opportunity to submit a brief.

(5) Please complete and mail the enclosed postcard, indicating whether you presently intend to seek review of this decision. Your response on the card does not bind you in any way, but assists the Commission in scheduling future workload.

(6) For further details on the review process, see Commission Rules 90, 91, 92, 93, 94, and 95.

## DECISION

The Decision in this case was filed on June 15, 1978. On February 25, 1981, the Commission entered its decision remanding the case for further proceedings "consistent with this decision.". A second hearing in this case was held on May 5, 1981.

The Commission Decision held in part that an employment relationship existed and that Rod Carew was the employer. However, the Commission appeared to condition this conclusion on my finding concerning the compliance officer's credibility. After hearing his testimony and witnessing his demeanor while testifying, I find that the compliance officer's testimony was highly credible. Therefore, I must conclude that an employment relationship existed and that Rod Carew was the employer and the Respondent in this case.

The only evidence received in this case was the testimony of the compliance officer. This has already been held to be credible. Therefore, all facts stated in this testimony are found to be facts in this case.

On November 3, 1977, the compliance officer and Mr. Earl Lawrence, a diving consultant, inspected the Respondent's vessel "Sea Otter 75" which was anchored near Indian Head Point near Port Townsend, Washington. At the time the Respondent's employees were engaged in harvesting Geoducks, which are large clams. As a result of the inspection, on November 15, 1977 the Secretary issued two citations charging the Respondent

with five violations of the commercial diving operation's safety standards of the Occupational Safety and Health Act.[1/] The Respondent has denied the charges.[2/]

The Respondent has denied jurisdiction. However, the evidence establishes that the Respondent was an employer with employees engaged in a business that affects commerce within the meaning of the Act. Therefore, jurisdiction has been established.

At the time of the inspection, three of the Respondent's employees were aboard the vessel; two divers and a tender. The vessel operated as a platform from which surface supplied air was pumped down to the divers through two hundred feet of air line. The divers searched the bottom of Puget Sound seeking Geoducks buried in the sand. The divers did not have a two-way voice communication system. Nor was each diver continuously tended while in the water.

During the course of the trial, the Respondent admitted the violative conditions concerned in Citation 1, Item 1 and all of the items in Citation 2. In addition it was admitted that the Respondent had knowledge of these violative conditions and that employees had access to the hazards.[3/]

## OPINION

The inspection was fair. The Respondent's employee in charge did not object to the inspection and therefore waived any right to require a search warrant. The evidence

established each of the violations as alleged. In each instance the employer had knowledge of these conditions and that employees were exposed to the areas of danger. There was a substantial probability that the violative conditions alleged in Citation No. 1 could result in serious physical harm or the death of one or more of the employees. Therefore, these citations will be affirmed as alleged.

The evidence indicates that the Respondent had a small business and no previous history of violations. There was no indication of bad faith on its part. Therefore, after considering this and the gravity of the violations it is concluded that the proposed penalties are appropriate.

## ORDER

The citations, as amended, and the proposed penalties are AFFIRMED. Total penalties of $240 are ASSESSED.

ERWIN L. STULLER
Judge

DATED: February 17, 1982

## FOOTNOTES

1/ After the original citations were issued, an amendment to the Complaint and Citation 1, Item 1 was allowed. A description of the alleged violations, the proposed penalties, and the safety standards concerned, as amended, are as follows:

Citation 1, Item 1 (Serious)

> An operating two-way voice communication system was not used between dive team member on board "Sea Otter 75" (dive location) and diver at bottom in approximately 20 feet salt water off Indian Head Point, opposite Port Tonwsend. Surface supplied air diving operation harvesting geoducks.

in violation of 29 CFR 1910.422(c)(1)(i)

Penalty Proposed: $140

29 CFR 1910.422(c)(1)(i) provides:

> An operational two-way voice communication system shall be used between each surface-supplied air or mixed-gas diver and a dive team member at the dive location or bell (when provided or required).

Citation 1, Item 2 (Serious)

> A surface supplied air diver was not being continuously tended in that the tender aboard dive location "Sea Otter 75" off Indian Head Point, Port Townsend, was not keeping the slack out of the lines in order to feel the pull signals on the air hose/ lifeline from the diver. The tender was not maintaining a proper tension by hand at all times on the air hose/airline.

in violation of 29 CFR 1910.425(c)(1)

Penalty Proposed: $100

29 CFR 1910.425(c)(1) provides:

> Each diver shall be continuously tended while in the water.

Citation 2, Item 1 (Other)

> An emergency aid list was not kept at the dive location, "Sea Otter 75" with the telephone on-call numbers of the following: (a) an operational compression chamber, (b) accessible hospitals, (c) available physicians, (d) available means of transportation or (e) U.S. Coast Guard Reserve Coordination Center.

in violation of 29 CFR 1910.421(b)

Penalty Proposed: none

29 CFR 1910.421(b) provides:

> A list shall be kept at the dive location of the telephone or call numbers of the following: (1) an operational decompression chamber (if not at the dive location); (2) accessible hospitals; (3) available physicians; (4) available means of transportation; and (5) the nearest U.S. Coast Guard Rescue Coordination Center.

Citation 2, Item 2 (Other)

> The employer did not maintain a Safe Practices Manual and the Manual was not available at the dive location to each dive team member.

in violation of 29 CFR 1910.420(a)

Penalty Proposed: none

29 CFR 1910.420(a) provides:

> The employer shall develop and maintain a safe practices manual which shall be made available at the dive location to each dive team member.

Citation 2, Item 3 (Other)

> The records of dive information including: date, time, location, dive team members/person in charge, diving modes, general nature of work performed, approximate underwater and surface conditions and a maximum depth bottom for each diver was not available and properly maintained aboard "Sea Otter 75" on date of inspection.

in violation of 29 CFR 1910.423(d)(1)(i)

Penalty Proposed: none

29 CFR 1910.423(d)(1) provides:

> The following information shall be recorded and maintained for each diving operation: Names of dive team members including designated person-in-charge; date, time, and location; diving modes used; general nature of work performed; approximate underwater and surface conditions (visibility, water temperature and current); and maximum depth and bottom time for each diver.

2/ The violations were alleged to have taken place at the time of the inspection on November 3, 1977. The citations charge that the Respondent failed to comply with commercial diving operation's safety regulations in violation of Section 654(a)(2) of the Occupational Safety and Health Act (29 U.S.C. 651 et seq.). Citation No. 1 charges two serious violations of the Act. Citation No. 2 charges three nonserious violations of the Act. The Respondent filed a timely notice of contest. At that point the Commission acquired jurisdiction over the subject matter under Section 659 of the Act.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>HERMITAGE CONCRETE PIPE COMPANY,<br><br>Respondent. | OSHRC Docket No. 4678 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

In a prior decision, 1/ a divided Commission concluded that although Respondent, Hermitage Concrete Pipe Co. ("Hermitage"), had violated the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"), by failing to comply with the health standard at 29 C.F.R. § 1910.1000(c), 2/ the violation was not "serious" within the meaning of section 17(k) of the Act, 29 U.S.C. § 666(j). The case is now before the Commission on remand by the United States Court of Appeals for the Sixth Circuit. Usery v. Hermitage Concrete Pipe Co., 584 F.2d

---

1/ Hermitage Concrete Pipe Co., 76 OSAHRC 2/C1, 3 BNA OSHC 1920, 1975-76 CCH OSHD ¶ 20,298 (No. 4678, 1976).

2/ After the judge's decision in this case was issued, the cited standard, 29 C.F.R. § 1910.93(c), was recodified at 29 C.F.R. § 1910.1000(c). 40 Fed. Reg. 23072 (1975). Because the recodification consisted only of renumbering the standard, the new number will be used.

29 C.F.R. § 1910.1000(c) provides:

> Table Z-3: An employee's exposure to any material listed in Table Z-3, in any 8-hour work shift of a 40-hour work week, shall not exceed the 8-hour time weighted average limit given for that material in the table.

127 (6th Cir. 1978). In that decision, the Sixth Circuit rejected a Commission majority's conclusion that the violation was not "serious" because the Secretary of Labor ("the Secretary") had failed to prove that death or serious harm "would" result from exposure to the levels of respirable silica dust in Hermitage's workplace. The court held that the proper test to be applied in determining whether a violation of the Act is serious under section 17(k) of the Act [3/] is whether death or serious physical harm "could" result from the violative condition. 584 F.2d at 131-132. The court remanded the case for the Commission to re-examine whether the violation was serious.

Most of the facts are not in dispute. The Secretary's industrial hygienist took air samples at Hermitage's plant, and the samples indicated that Hermitage's employees were exposed to respirable silica dust in excess of the threshold limit values (TLV) set out at 29 C.F.R. § 1910.1000(c), Table Z-1. The samples showed concentrations of up to 7 times the permitted levels. Hermitage conceded the existence of levels in excess of the TLV. It also conceded that silicosis was a serious disease and that silica dust is dangerous to health. However, Hermitage contended that it did not know or have any reason to know of the presence of silica dust in its workplace. In his decision, the Review Commission's administrative law judge found that the Secretary had failed to show that Hermitage had knowledge of

---

3/ Section 17(k), 29 U.S.C. § 666(j), provides:

> (k) For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

the presence of silica dust. He therefore characterized the alleged violation as other than serious before vacating the citation on other grounds.

On review, a Commission majority (Commissioner Cleary dissenting) found that the Secretary had failed to introduce evidence to establish that the levels of silica dust to which Hermitage's employees were exposed "would" cause death or serious physical harm. The Commission affirmed the violation as other than serious and did not reach the issue of knowledge.

On remand, we are charged with determining whether the Secretary has proven that the violation by Hermitage was serious. In order to establish a serious violation of the Act, the Secretary must establish that (1) death or serious physical harm could result if the standard is violated, and (2) that the employer has actual or constructive knowledge of the violative condition. 4/ See Niagara Mohawk Power Corp., 76 OSAHRC 36/A2, 7 BNA OSHC 1447, 1979 CCH OSHD ¶ 23,670 (No. 76-2414, 1979).

On review, Hermitage had argued that the Secretary had not shown that it had "knowledge or imputed knowledge" that its employees were exposed to silica dust. Hermitage's superintendent and general manager, who had a combined total of thirty-six years experience in the manufacture of conduit pipe, testified at the hearing that they had never encountered a problem with silica dust.

On review, the Secretary had contended that various exhibits that he had attempted to introduce at the hearing would have demonstrated that "there was sufficient material . . . available to [Hermitage], so that it knew, or with the exercise of reasonable diligence could have known of the presence of the violation."

---

4/ In his brief on remand, the Secretary does not address the knowledge issue. Hermitage did not submit a brief on remand. Both parties did, however, address the knowledge issue both before the judge and on review before the Commission.

Citing to American Smelting and Refining Co. v. Brennan, 501 F.2d 504 (8th Cir. 1974), the Secretary had contended that Hermitage could not rely on self-serving declarations that it did not know of the violative levels, when it was clear that Hermitage had a duty to discover the hazard and protect its employees from it.

We conclude that Hermitage could have known of the presence of respirable silica dust with the exercise of reasonable diligence. Both of the operations cited in this case involve the discharge of sand into the atmosphere. In the batch area, sand and cement were poured into pipe and conduit casting machines. In the finishing area, dried conduit was chipped, ground, and cleaned using compressed air. Even if these operations had not raised visible clouds of dust, they did send particles of sand or cement into the air. An employer has a duty under the Act to anticipate the hazards to which its employees may be exposed and to take the steps necessary to prevent such exposure. Automatic Sprinkler Corp. of America, 79 OSAHRC 102/A2, 7 BNA OSHC 1957, 1979 CCH OSHD ¶ 24,077 (No. 76-5271, 1979). It is our judgment that a reasonably diligent employer who knows that his employees chip, grind and blow particles of sand and cement from pipe into the air would conduct tests to discover what substances its employees are exposed to, whether the particles are respirable, and in what concentrations they are present. Had Hermitage been reasonably diligent it would have discovered what the Secretary's industrial hygienist discovered, even if it had no idea that any particular disease or substance might be associated with its operations.

In its brief on remand to the Commission, the Secretary argues that exposure to the levels of silica dust in Hermitage's plant could cause death or serious physical harm. The Secretary contends that in order to establish that a violation is serious he need only show an exposure or exposures to excessive

levels of respirable silica dust that if continually experienced could cause death or serious physical harm. The Secretary relies on the industrial hygienist's "unrebutted expert testimony that regular exposure to free silica at the levels Hermitage employees inhaled daily could result in contraction of silicosis." He also points out that the TLV for respirable silica dust is consistent with the epidemiological data demonstrating the upper limits of exposure for studied employees who did not contract silicosis. He cites from the concluding statement in the publication of the American Conference of Governmental Industrial Hygienists (ACGIH), which contains the documentation for the TLV:

> The margin of safety of the quartz [free silica] TLVs is not known. In the documented examples of virtual silicosis elimination, concentrations have averaged well below the TLV. It is suggested that quartz concentrations be maintained as far below the TLV as current practices will permit.

ACGIH, Documentation of the Threshold Limit Values for Substances in Workroom Air, 230 (3d ed. 1971). 5/

The Secretary also contends that the precise causal link between levels and durations of exposure and the contraction of the disease is a question on the frontiers of scientific knowledge and is incapable of precise scientific proof. To require proof of a causal link in addition to proof that the required levels and durations existed would, in his view, limit serious citations to situations in which the possibility of contracting a disease is shown by its actual occurrence. The Secretary argues that the violation in this case is serious because Hermitage's employees were exposed to a toxic substance at levels that, assuming

---

5/ The text the Secretary relies on was published in 1971. The TLV for respirable silica dust was derived from a recommended limit proposed by the American Conference of Governmental Hygienists ("ACGIH") in 1968. This TLV was adopted by the Secretary as a standard under the Walsh-Healey Public Contracts Act, 41 U.S.C. § 35-45, and was codified at 41 C.F.R. § 50-204.50 34 Fed. Reg. 788-96 (1969). The Walsh-Healey standard was subsequently adopted as an established Federal standard under § 6(a) of the Occupational Safety and Health Act of 1970, 29 U.S.C. § 655(a), and was codified origi-

(footnote cont'd)

chronic exposure, could cause a disease from which a substantial probability of death or serious harm arises. The Secretary claims that he is not arguing that every violation of a TLV is automatically a serious violation; he acknowledges that serious physical harm is possible only at "sufficiently high levels" of many regulated substances. He directs us to the OSHA Substance Toxicity Table, in Chapter II of the Industrial Hygiene Field Operations Manual, at II-31 (OSHA Instruction CPL 2-2.20). That table recommends to the Secretary's enforcement personnel that a violation of the TLV for silica be classified as serious.

In sum, the Secretary argues that (1) regular exposure to free silica at levels proven to exist on at least one occasion could result in the contraction of silicosis and (2) the readings taken at Hermitage's plant can be taken as representative of conditions there in the absence of a showing by Hermitage that they were exceptional.

There is no evidence here that the overexposures measured by the Secretary's industrial hygienist were typical of the exposure of Hermitage's employees. The Secretary also does not claim that the measured overexposures, by themselves, could have caused death or serious physical harm. The Secretary, and the supporting ACGIH documents, focus instead on the effects of long-term exposure to silica dust. This case, therefore, is unlike those in which a single exposure could cause death or serious physical harm, e.g., a single exposure to cyanide gas or an unshored trench. Accordingly, we must consider whether a serious

---

(footnote 5 cont'd)

nally at 29 C.F.R. § 1910.93, Table G-1 (recodified at 29 C.F.R. § 1910.1000(c), Table Z-1). 36 Fed. Reg. 10466 (1971); 36 Fed. Reg. 15101 (1971). Because the 1971 ACGIH recommended limit was identical to the 1968 version, we think it reasonable to conclude, in the absence of evidence to the contrary, that the basis for the recommendation in 1971 was the same as it was in 1968. See Anaconda Aluminum Co., 81 OSAHRC 27A/A2, 9 BNA CSHC 1460, 1471 n.28, 1981 CCH OSHD ¶ 25,300, p. 31,344 n.28 (No. 13102, 1981).

violation can be found in these circumstances. In particular, we must consider whether to presume that the measured overexposures were representative of long-term exposures.

In some cases, the evidence clearly will demonstrate that the exposures measured during the inspection of a workplace are representative of the usual exposures in that workplace. In other cases, such as this one, whether the exposures were representative may not be apparent from the evidence. The Secretary, whose presence in a workplace is necessarily occasional, is usually not in a position to chronicle long-term exposure to a toxic substance at a worksite. The Secretary is also unlikely to be able to obtain information on this point through discovery if, as here, the employer has not kept records of employee exposures. Yet, where, as here, the same objects are manufactured regularly, a realistic estimate of the probabilities suggests that workplace conditions tend to remain the same. See generally McCormick, Law of Evidence, § 337 at 787-789 (2d Ed. 1972). It is also evident that the employer is in the most favorable position to show that normal exposure differs from the exposure measured by the Secretary. See Trinity Industries, Inc., 81 OSAHRC 30/A2, 9 BNA OSHC 1515, 1981 CCH OSHD ¶ 25,297 (No. 77-3009, 1981). Finally, the presumption is not so far-reaching as to unfairly burden employers. Because we are dealing only with the characterization of a violation, the only consequence of the presumption to employers is to make it somewhat more likely that the Commission will be required to assess a penalty of up to $1,000; for nonserious violations, the assessment of a penalty of up to $1,000 is discretionary. Compare section 17(b) of the Act, 29 U.S.C. §§ 666(b), with section 17(c), 29 U.S.C. § 666(c). We therefore presume that the exposures measured by the Secretary are, for the purpose of determining seriousness, representative of typical exposures. An employer may rebut this evidentiary presumption by showing that the exposures or work condi-

tions on the day of the measured exposure were not representative of normal exposures or work conditions.

Here, Hermitage has not argued that the exposures or work conditions on the day of the inspection were in any way unrepresentative, nor did it present rebuttal evidence on the issue. However, because Hermitage has not had an opportunity to meet or rebut the presumption, we will afford Hermitage an opportunity to present evidence challenging the representative nature of the exposures. We will therefore presume that the readings taken by the Secretary accurately reflect the amounts of respirable silica dust to which Hermitage's employees are usually exposed unless Hermitage requests within ten days an opportunity to present evidence on the representative nature of the exposures.

A serious violation of the Act is not necessarily established by proof that workers are exposed to a concentration of a toxic material in excess of the levels set out in 29 C.F.R. § 1910.1000(c). However, in Anaconda Aluminum Co., 81 OSAHRC 27A/A2, 9 BNA OSHC 1460, 1477, 1981 CCH OSHD ¶ 25,300, p. 31,349 (No. 13102, 1981), a case involving exposure to coal tar pitch volatiles, the Commission held that if the purpose in limiting exposure to a particular substance is to protect against contraction of a life-threatening disease, then an employer's failure to reduce employee exposure to that substance to within the limits specified by the standard is a serious violation. It is undisputed in this case that Hermitage's employees were exposed to levels of respirable silica dust in excess of the permissible limit. The documentation for the selection of the recommended limit reveals that the possibility of contracting silicosis was the central factor in setting the TLV. 6/ ACGIH, Documentation of the Threshold Limit Values, at 227-30. In short, the limit was set with the intention of preventing

---

6/ In this case, the unrebutted testimony of the industrial hygienist establishes that Hermitage's employees were exposed to dangerous levels of silica dust -- exposures which could result in the contraction of silicosis.

the contraction of silicosis, a life-threatening disease. [7/] See Urie v. Thompson, 337 U.S. 163, 180 (1948). Accordingly, we find Hermitage to be in serious violation of the Act for failing to comply with 29 C.F.R. § 1910.1000(c).

In our previous decision, we found Hermitage in other-than-serious violation of the Act for failing to comply with 29 C.F.R. § 1910.1000(c). We assessed a penalty of $100. Although we now find the violation to be serious, we conclude that $100 is still an appropriate penalty.

Accordingly, we affirm a serious violation of section 5(a)(2) of the Act, 29 U.S.C. § 654(a)(2), for Hermitage's failure to comply with the standard at 29 C.F.R. § 1910.1000(c) and assess a $100 penalty unless within ten days of this decision Hermitage requests an opportunity to present evidence on the representative nature of the exposures.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: MAR 23 1982

---

7/ A review of the Act's legislative history reveals a congressional recognition of the seriousness of silicosis. In discussing what he described as the "silent killers in the form of . . . debilitating dust particles that have become commonplace ingredients of the manufacturing process," Congressman Udall noted that "[s]ilicosis is another major crippling and deadly respiratory disease common to industry." Remarks of Congressman Udall, SEN. COMM. ON LABOR & PUBLIC WELFARE, 92d CONG., 1st SESS., LEGISLATIVE HISTORY OF THE OCCUPATONAL SAFETY AND HEALTH ACT OF 1970, at 1044-5 (1971).

ROWLAND, Chairman, dissenting:

I dissent from the majority's characterization of the violation as "serious" and from the assessment of a $100 penalty.

In my view, the Secretary has failed to show that Hermitage's employees were exposed to levels of silica dust that could cause death or serious physical harm. The majority, relying on Anaconda Aluminum Co., 81 OSAHRC 27A/A2, 9 BNA OSHC 1460, 1981 CCH OSHD ¶ 25,300 (No. 13102, 1981), holds that exposure to levels of silica dust above the threshold limit value (TLV) constituted a serious violation of the Act because the TLV for silica dust was set with the intention of preventing the contraction of silicosis, a life-threatening disease.

It is not necessary for me to decide here whether the Anaconda approach is correct, for although it is probably the most expansive interpretation of section 17(k) that could be adopted, the evidence relied on by the majority does not satisfy it. In concluding that the TLV for silica dust was set to prevent silicosis, the majority relies on the documentation that evidently supported the selection of the TLV, American Conference of Government Industrial Hygienists ("ACGIH"), Documentation of the Threshold Limit Values for Substances in Workroom Air (3d ed. 1971). The ACGIH states there that the margin of safety of exposure to silica dust is unknown and that when concentrations of silica dust have averaged well below the TLV, silicosis has been virtually eliminated. However, the documentation does not show levels at which employees could contract silicosis, nor does it show that the ACGIH set the TLV to prevent silicosis, rather than to prevent less severe health effects. Moreover, in the preface to the ACGIH publication that was the source for the TLV for silica dust and other substances, the reader is cautioned against absolute reliance on the TLV's. See ACGIH, Threshold Limit Values of Airborne Contaminants for 1968 (1968). There the ACGIH notes that the TLV's represent levels under which it is believed that nearly all workers may

be repeatedly exposed day after day without adverse effect. Id. at 1. It emphasizes that TLV's "should be used as guides in the control of health hazards and should not be regarded as fine lines between safe and dangerous concentrations." Id. The ACGIH further notes that "[t]he basis on which the values are established may differ from substance to substance; protection against impairment of health may be the guiding factor for some, whereas reasonable freedom from irritation, narcosis, nuisance or other forms of stress may dominate the basis for others." Id. Although the ACGIH states that in its opinion "limits based on physical irritation should be considered no less binding than those based on physical impairment," it states that these limits "are not intended for use, or for modification for use . . . as a relative index of toxicity, . . . in estimating the toxic potential of continuous uninterrupted exposures, . . . [or] as proof or disproof of an existing disease or physical condition." Id. at 2. Nevertheless, the majority has found the TLV to be just such a dividing line. Although Hermitage's employees were exposed to silica dust up to 7 times the permissible level, the ACGIH documents caution against using the TLV as a basis for estimating safe and dangerous concentrations. I am therefore unable to say that silicosis could result from such exposures. For this reason, I conclude that a serious violation of the Act has not been shown.

Although it is not clear that exposures to respirable silica dust in excess of the TLV could lead to death or serious physical harm, the Secretary nevertheless argues that it would be preferable to err on the side of greater rather than less caution. See Titanium Metals Corp. v. Usery, 579 F.2d 536 (9th Cir. 1978). However, a conclusion that an employer did not commit a serious violation of the Act would not leave his employees without protection. If an employer violates the Act by exposing his employees to levels of a toxic substance above the TLV, he is required to abate those excessive levels in the same manner he would have had to abate them had the violation been characterized as serious.

Because I do not find that the Secretary has shown that conditions at Hermitage's plant could cause death or serious physical harm, it is unnecessary for me to determine whether Hermitage knew or, with the exercise of reasonable diligence, could have known of the presence of excessive levels of respirable silica dust at its workplace. I do note, however, that my approach to knowledge in such cases has differed from that of the majority. See Mahone Grain Corp., 81 OSAHRC _____, 10 BNA OSHC 1275, 1982 CCH OSHD ¶ 25,836 (No. 77-3041, 1981)(Rowland, Chairman, dissenting). While knowledge is also a part of the Secretary's burden of proof as to nonserious violations of the Act, Hermitage did not file a petition for review of the previously-affirmed citation with the Court of Appeals. Thus, whether a violation occurred is not before us on remand. The Commission is limited to determining whether the violation was serious.

Finally, I have considered the evidence on the appropriate penalty. See 3 BNA OSHC at 1922, 1975-76 CCH OSHD at p. 24,201 (lead opinion). In view of Hermitage's good faith, lack of a history of previous violations, medium size, and the low gravity of the violation, I would assess no penalty.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>THE STACEY MANUFACTURING COMPANY,<br>Respondent. | OSHRC Docket No. 76-1656 |

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE Commissioners.

BY THE COMMISSION:

A decision of Review Commission Judge Louis G. LaVecchia is before the Commission for review under 29 U.S.C. § 661(i), section 12(j) of the Occupational Safety and Health Act of 1970, 29 U.S.C. § 651-678 ("the Act"). Judge LaVecchia affirmed two items of a citation issued by the Secretary of Labor ("Secretary") alleging that Respondent, Stacey Manufacturing Company ("Stacey"), violated section 5(a)(2) of the Act by failing to comply with the machine guarding standards at 29 C.F.R. §§ 1910.212(a)(1) and 1910.212(a)(3)(ii). The judge characterized the two violations as serious and assessed penalties of $60 and $30. For the reasons that follow, we vacate item 5 of the citation, alleging noncompliance with 29 C.F.R. § 1910.212(a)(1), but affirm item 11 of the citation alleging noncompliance with 29 C.F.R. § 1910.212(a)(3)(ii).

I

Stacey is a manufacturer of steel products, including pressure vessels. It has no regular line of products but custom-makes its products to the purchaser's

requirements. Item 5 of the citation alleges a violation of 29 C.F.R. § 1910.212 (a)(1) 1/ in that Stacey failed to provide guarding on a Cincinnati shear that would prevent the operator's hand from accidental contact with the blades and the material hold-downs.

The shear is used to cut steel plate to the required size. A horizontal pipe and two parallel bars running the length of the bed of the shear separate the operator of the machine from the cutting blade. The distance between the surface on which the steel plates are positioned and the pipe is 1 inch. The distance between the pipe and middle bar is 1-3/8 inches, and between the middle and upper bars is 1-5/8 inches. Between the pipe and bars and the blade is a vertically-moving hold-down device, part of which consists of a round metal pad three inches in diameter that descends to hold the steel plates in position for cutting. The distance between the pipe and the hold-down device is 1-5/8 inches. Between the pipe and the blade, the distance is 5 1/4 inches. To operate the shear, the operator places a steel plate on the bed and slides it under the pipe and metal bars. The pipe moves upwards a little to let the steel plate pass underneath. By depressing a pedal, the operator activates the machine. First, the hold-down devices descend to hold the steel plate in place; then the blade descends and cuts the steel plate.

---

1/ The standard states:

> General Requirements for all machines
>
> (a) Machine guarding-(1) Types of guarding. One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation, ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are-barrier guards, two-hand tripping devices, electronic safety devices, etc.

The compliance officer testified that despite the presence of the pipe and bars, it was possible for the operator to insert his hand or fingers into the spaces between the bars and between the bars and the pipe, where they could be crushed or severed by the descending hold-downs or blades. There was no evidence that any work operation required an employee to put any part of his body under or between the bars, nor is there a history of injuries on the cited shear.

The compliance officer also testified that the point of operation on the shear could be guarded with a piece of plexiglass or hardware cloth (wire screen) at minimal cost. Stacey's operation manager did not deny that plexiglass or hardware cloth could be used to guard the point of operation, but he testified that the use of plexiglass would impair the operator's vision because of dust accumulation. He also testified that the plexiglass would constantly have to be replaced because the steel plates, which are up to twelve feet square and may weigh over a ton, would bang the plexiglass and cause it to break. The plates must be lifted with a crane, and it is impossible to keep them from swinging and smashing a plexiglass guard.

Item 11 of the citation alleged a violation of 29 C.F.R. § 1910.212 (a)(3)(ii) 2/ in that Stacey failed to guard the point of operation of a hole punch machine. A penalty of $30 was proposed by the Secretary. The punch had two dies, one above the other, and stationary hold-down devices to hold in place

---

2/ Section 1910.212(a)(3)(ii) provides:

> The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor, or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

the material to be punched. The lower die had a 1/2 inch opening, which could be adjusted to 1-1/4 inches. The upper die would travel 1-1/4 inches downward to punch the metal resting on the lower die. During the normal operation of the hole punch, the operator would position both hands on the material to be punched and hold it in place before he stepped on the treadle. During this operation, the operator's hands would be located inches from the point of operation.

Stacey's shop steward admitted that the operator could punch his hand or finger while the punch traveled downward to punch the metal, although he expressed the opinion that the likelihood of such an accident was small. The compliance officer testified that the point of operation on the hole punch could be guarded by a piece of plexiglass or hardware cloth at minimal cost.

The judge found Stacey in violation of both standards. He concluded that neither machine was properly guarded, and that the operators of both machines were exposed to injury.

In its brief on review, Stacey advances three reasons for the reversal of the judge's decision. First, it maintains that the pipe and bars, known in the industry as "awareness guarding," properly guarded the shear because awareness guarding is a "method of machine guarding" within the meaning of section 1910.212 (a)(1). It also claims that it satisfied the requirements of ANSI B11.4-1973, Requirements for the Construction, Care, and Use of Shears, a standard published by the American National Standards Institute (ANSI). 3/ Stacey contends that ANSI standards provide acceptable methods of complying because 41 C.F.R. § 50-204. 2(a), a regulation issued under the Walsh-Healey Public Contracts Act, 41 U.S.C. §§ 35-45, provided:

---

3/ At the hearing Stacey's safety manager stated that its shear should have been cited under 29 C.F.R. § 1910.212(a)(3)(ii) and that ANSI B11.4(1973) was, under the terms of that section, an "appropriate standard therefor."

> Every contractor shall protect the safety and health of his employees with the applicable standards, specifications and codes developed and published by the following organizations: . . . American National Standards, Inc.

This provision was amended on May 29, 1971. 36 Fed. Reg. 9868 (1971).

Second, Stacey contends that the evidence does not sustain a violation of section 1910.212(a)(3)(ii) as to the hole punch because the compliance officer never saw the hole punch in operation and there was no employee near the machine during the inspection. Stacey argues that in the absence of first-hand testimony from the compliance officer as to how the machine worked and the manner in which employees were exposed to injury, no accurate determination of whether the operator was exposed to injury can be made.

Third, Stacey contends that the Secretary's post-hearing brief was not timely filed with the judge. It contends that this failure to comply with Commission Rule 76, 29 C.F.R. § 2200.76, 4/ provides sufficient grounds for vacation of the items in issue.

II

Stacey's reliance on ANSI B11.4-1973 raised the issue of whether the phrase "any appropriate standard therefor" in section 1910.212(a)(3)(ii) refers to ANSI standards, especially ANSI standards such as B11.4-1973, that were issued after

---

4/ The rule provides:

> Rule 76 Filing of briefs and proposed findings with the Judge; oral argument at the hearing.
>
> Any party shall be entitled, upon request, to a reasonable period at the close of the hearing for oral argument, which shall be included in the stenographic report of the hearing. Any party shall be entitled, upon request made before the close of the hearing, to file a brief, proposed findings of fact and conclusions of law, or both, with the Judge. The Judge may fix a reasonable period of time for such filing, but such initial period may not exceed 20 days from the receipt by the party of the transcript at the hearing.

the promulgation of section 1910.212. In order to allow the parties an opportunity to address that issue, and other collateral issues, the Commission issued an order requesting briefs on those issues.

In response to the briefing order, the Secretary contends that ANSI standards are not incorporated by reference in section 1910.212. He claims that the terms, "appropriate standards" and "applicable specific standards," used in section 1910.212(a)(3)(ii) are synonomous. He cites Kroehler Mfg. Co., 78 OSAHRC 88/B9, 6 BNA OSHC 2045, 1978 CCH OSHD ¶ 23,110 (No. 76-2120, 1978). However, the Secretary also noted that because section 1910.212 is a performance standard, ANSI standards could serve as possible guarding guidelines. The Secretary stated that "OSHA will treat violations of certain standards as de minimus if the employer has complied with an updated material consensus standard which provides safety and health protection equal to or greater than the protection provided by the OSHA standard."

The Secretary suggests that 41 C.F.R. § 50-204.5(c)(2), which is the source of 29 C.F.R. § 1910.212(a)(3)(ii), indicates that the only standards of private organizations incorporated by reference into Part 1910 were specific national consensus standards either published in Part 1910 or explicitly incorporated by reference there. He argues that ANSI B11.4-1973 was not issued by ANSI until after the expiration of the two year period during which the Secretary was empowered to promulgate standards under section 6(a) of the Act and thus he could not have promulgated it as an OSHA standard unless the rulemaking requirements of section 6(b) were met. Stacey did not reply to the briefing order.

III

We first examine Stacey's claim that by complying with ANSI B11.4-1973, it provided "[o]ne or more methods of machine guarding . . . to protect the operator . . . from [machine] hazards . . ." within the meaning of section 1910.212(a)(1).

Section 1910.212 is to be read as a whole and its provisions, particularly sections 1910.212(a)(1) and (a)(3)(ii), are to be construed together. Hughes Brothers, Inc., 78 OSAHRC 65/A2, 6 BNA OSHC 1830, 1833, 1978 CCH OSHD ¶ 22,909, p. 27,717 (No. 12523, 1978). See also Consolidated Aluminum Corp., 80 OSAHRC 125/A2, 9 BNA OSHC 1144, 1156, 1981 CCH OSHD ¶ 25,069, p. 30,976 (No. 77-1091, 1980), appeal filed, No. 81-3079 (6th Cir. February 16, 1981). Thus, although Stacey is alleged to have violated the more general, introductory requirement of section 1910.212(a)(1) rather than section 1910.212(a)(3)(ii), we will analogize to the latter provision in evaluating Stacey's argument.

Section 1910.212(a)(3)(ii) permits employers to comply with "any appropriate standards therefor" instead of providing point-of-operation guarding in conformance with that section's performance criterion. We have recently held that an "appropriate standard" within the meaning of section 1910.212(a)(3)(ii) means standards either published or incorporated by reference in 29 C.F.R. Part 1910. George Christopher & Sons, Inc., OSHRC Docket No. 76-647 (February 26, 1982). Inasmuch as sections 1910.212(a)(1) and (a)(3)(ii) are to be construed similarly, it follows that a "method of machine guarding" permitted by section 1910.212(a)(1) must be a method permitted by one of the standards published or incorporated by reference in 29 C.F.R. Part 1910, including the performance criteria of sections 1910.212(a)(1) and 1910,212(a)(3)(ii). Inasmuch as ANSI B11.4-1973 is neither published nor incorporated by reference in 29 C.F.R. Part 1910, we cannot conclude that providing guarding in accordance with ANSI B11.4-1973 necessarily means that one has provided "one or more methods of machine guarding . . . to protect the operator . . . from [machine] hazards . . . ."

In order to establish a violation of 29 C.F.R. § 1910.212(a)(1), the Secretary must first prove the existence of a hazard. A.E. Burgess Leather Co., 77

OSAHRC 25/D6, 5 BNA OSHC 1096, 1977-78 CCH OSHD ¶ 21,573 (No. 12501, 1977), aff'd, 576 F.2d 948 (1st Cir. 1978). We conclude that the Secretary has failed to do so.

Stacey's employees could be injured by the hold downs and blade on the shear only if they put their hands under the bottom bar or through the other openings. That it is not impossible for an employee to put his hand under the hold-down or blade does not demonstrate that the employee was exposed to injury. See Rockwell International Corp., 81 OSAHRC 118/A2, 9 BNA OSHC 1092, 1097, 1980 CCH OSHD ¶ 24,979, p. 30,846 (No. 12470, 1980). Whether a machine presents a hazard must be determined by how the machine functions and how it is operated by the employees. See id. Here, the material to be cut is not hand-held, the employees have no reason to put their hands under the blade or the hold-downs, and their ability to inadvertently reach the blades and the hold-downs is greatly restricted by the pipe and the horizontal bars. Under these circumstances, we conclude that no hazard requiring further guarding under section 1910.212(a)(1) has been shown with respect to the shear. Item 5 is therefore vacated.

With respect to the hole punch, we reject Stacey's contention that the failure of the compliance officer to see the machine in operation or operated by one of Stacey's employees is fatal to the Secretary's case. The cited standard, section 1910.212(a)(3)(ii), requires that the point of operation of a machine be guarded if the operator is exposed to injury, and that the guarding device be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle. Stacey's hole punch machine has no point of operation guard. The upper die descends during the operating cycle 1 1/4 inches to the lower die and there is nothing to prevent the operator's hands from entering the point of operation during the operating cycle. The operator's hands were inches from the point of operation and Stacey's shop

steward testified that the operator could punch his hand or finger. There is abundant evidence to establish that employees were exposed to a point of operation hazard and that the point of operation was unguarded. 5/

Finally, Stacey contends that the two items in issue should be vacated because the Secretary failed to timely file his post-hearing brief. Stacey did not raise this issue before Judge LaVecchia. The issue is not jurisdictional. The Commission will generally not consider nonjurisdictional issues that have not been raised before the administrative law judge. Gulf Stevedore Corporation, 77 OSAHRC 135/E11, 5 BNA OSHC 1625, 1977-78 CCH OSHD ¶21,975 (No. 76-826, 1977). Moreover, Commission Rule 92(d), 29 C.F.R. § 2200.92(d), states that "except in extraordinary circumstances, the Commission's power to review is limited to issues of law or fact raised by the parties in the proceedings below." There are no extraordinary circumstances here. In addition, we note that Stacey did not file a petition for review raising this issue.

IV

Stacey employs between 150 and 180 people, does not have a history of violations and has demonstrated good faith in attempting to guard its machines. With respect to the gravity of the violation, we note that one employee was exposed to the violation, and that the consequence of an accident would have been severe. We conclude that under section 17(j) of the Act, 29 U.S.C. § 661(i), the judge's assessment of $30 was appropriate.

---

5/ To the extent that Stacey's argument encompasses more an objection to the reliability of the compliance officer's testimony, we observe that it is not necessary for the compliance officer to observe employee exposure to a hazard. It is sufficient to establish that employees have been or will be exposed, Circle Industries Corp., 76 OSAHRC 121/F4, 4 BNA OSHC 1724, 1976-77 CCH OSHD ¶ 21,119 (No. 4356, 1976); see General Electric Co., 80 OSAHRC 9/B9, 7 BNA OSHC 2183, 2185 n.6, 1980 CCH OSHD ¶ 24,268, p. 29,552 n.6 (No. 15037, 1980), or that the machine is available for use in a defective condition. Harold Christiansen and Harold W. Christiansen d/b/a Palmer Christiansen Co., 76 OSAHRC 39/D10, 4 BNA OSHC 1020, 1975-76 CCH OSHD ¶ 20,517 (No. 3108, 1976).

Accordingly, the judge's decision is reversed in part and affirmed in part. Item 5 of the citation, as it pertains to the Cincinnati shear, is vacated. Item 11 of the citation, alleging a failure to guard the hole punch, is affirmed. A penalty of $30 is assessed for item 11.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: MAR 23 1982

ROWLAND, Chairman, concurring in part and dissenting in part:

I agree with the majority that the Secretary has not shown that the point of operation of the shear presents a hazard and that item 5 of the citation should therefore be vacated. For this reason, it is unnecessary to consider at this time whether guarding that accords with ANSI B11.4-1973 is a "method . . . of machine guarding" within the meaning of 29 C.F.R. § 1910.212(a)(1), and whether sections 1910.212(a)(1) and (a)(3)(ii) should be read together. Accordingly, I do not join in the majority's discussion and resolution of those issues.

With respect to the punch press at issue in item 11, I disagree with the majority's holding that Stacey failed to comply with section 1910.212(a)(3)(ii). The evidence does not demonstrate that the operator was exposed to injury within the meaning of that standard. The compliance officer speculated that there was a possibility of accidental operation when the dies on the punch were at their maximum separation. But there was no evidence to suggest that any work process on the hole punch would require an employee to put his hand or finger into the point of operation; nor was there testimony as to how close the operator's hand came to the point of operation. Although one of the exhibits shows the operator holding the stock with his hand near the point of operation, the operator stands to the side of the point of operation, grips the stock with both hands, and feeds it into the point of operation. The material hold-downs are between the operator and the point of operation at all times. Therefore, the operator is protected from the dies by the hold-downs and his placement of both hands on the stock. The majority relies on the testimony of Mr. Grout, Stacey's shop steward, to support the proposition that an operator could be injured. However, Mr. Grout's testimony was wholly conjectural. Mr. Grout was responding to a hypothetical question that assumed that the operator would have his hands in the point of

operation; [1/] yet, this assumption is, as I have said, unsupported by the record. Indeed, Mr. Grout testified that in normal operation the machine was not hazardous.

The Commission has held that the way a machine functions and the manner in which it is operated by employees must be considered in determining whether it presents a hazard. See Rockwell International Corp., 81 OSAHRC 118/A2, 9 BNA OSHC 1092, 1097, 1980 CCH OSHD ¶ 24,979, p. 30,846 (No. 12470, 1980). There is nothing in the record to indicate that either the manner in which the machine functioned or the way it was operated exposed the operator to injury within the meaning of section 1910.212(a)(3)(ii). Accordingly, I would vacate item 11.

---

1/ The witness testified as follows:

> Q. Mr. Grout, if one accidentally placed his hand under the punch before the material were inserted and also accidentally mashed the pedal, could one get his hand punched under that machine, his finger?
> A. It's a possibility, but it seems very doubtful to me.
> Q. But it can happen, can't it?
> A. Anything can happen. I mean --
> Q. Anything can happen?
> A. -- on anything, I suppose.
> Q. Let me go into that. But it can conceivably happen, can't it?
> A. It's possible, yes.

| SECRETARY OF LABOR, Complainant, | : | |
| v. | : | DOCKET NUMBER 76-1656 |
| THE STACEY MANUFACTURING COMPANY, Respondent. | : | |

APPEARANCES:

Ronald J. Arrington, Esq., of Cleveland, Ohio for the Complainant.

J. G. McArdle, of Cincinnati, Ohio (Non-Attorney) for the Respondent.

Milton Grout (Non-Attorney), Union Representative

DECISION AND ORDER

LaVecchia, Judge, OSHRC:

This proceeding arises under Section 10 of the Occupational Safety and Health Act of 1970 (29 U.S.C. §651, et seq.), hereafter referred to as "the Act."

By citation issued March 17, 1976 complainant alleged that respondent violated Section 5(a)(2) of the Act through a failure to comply with safety standards published at 29 C.F.R. 1910.212(a)(1) and

29 C.F.R. 1910.212(a)(3)(ii), more specifically described below. A formal notice of contest was filed to the merits of the charges, and to the proposed penalties of $60 and $30 respectively on these standards, cited as violations under Items 5 and 11 of the citation.

The citation was issued as a result of an inspection of respondent's factory in Cincinnati, Ohio, on March 8, 1976. The hearing was held on August 4, 1976 in Cincinnati. Post-hearing briefs were filed by the parties.

THE VIOLATIONS CHARGED

The alleged violation of 29 C.F.R. 1910.212(a)(1) was described in the citation as follows:

> "Failure to provide machine guarding to protect the operator and other employees in the area from hazards such as those created by point of operation, ingoing nip points, rotating parts, and flying chips and sparks. e.g. Cincinnati shear in building #2 did not have point of operation guarded in that openings in the guard and under the guard permitted access to the shearing blades and material hold downs. * * *

This safety standard provides:

> "(a) Machine guarding - (1) Types of guarding. One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation, ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are--barrier guards, two-hand tripping devices, electronic safety devices, etc."

The alleged violation of 29 C.F.R. 1910.212(a)(3)(ii) was described in the citation as follows:

> "Failure to guard the point of operation of machines whose operation exposes an employee to injury. The guard shall conform with appropriate standards, or be

constructed so as to prevent the operator from having any part of his body in the danger zone during operating cycle. e.g. Point of operation on Long and Allstatter hole punch #U508 in building 2-A was not guarded from operator contact."

This safety standard provides:

"(a) [Same as above] (3)(ii) The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor, or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle."

THE ISSUES

With respect to 29 C.F.R. 1910.212(a)(1) two questions arise: (1) Did respondent provide a guard for the Cincinnati Shear which was adequate to prevent an employee from cutting his hand or fingers, or suffering the amputation thereof, by the shear blade? (2) Did respondent provide a guard for the Cincinnati Shear which was adequate to prevent an employee from pinching, or otherwise injuring his hands or fingers on the hold-down devices?

With respect to 29 C.F.R. 1910.212(a)(3)(ii) the question is whether respondent provided a guard for the Allstatter Hole Punch which was adequate to prevent an employee from pinching or otherwise injuring his hands or fingers. Secondarily, does the material itself form a guard for the operator, as insisted by respondent?

It is my opinion that all of these questions must be answered adversely to the contentions of respondent.

## SUMMARY OF RELEVANT EVIDENCE

Respondent has a plant in Cincinnati, Ohio. It is a custom manufacturer of pressure vessels and other equipment used principally in the manufacture of steel. Its products are fabricated from steel plates, and it ships and receives products and materials in interstate commerce. (Tr. 39,40). It does not have a product line, but performs a job-shop operation. (Tr. 55,56). Its gross revenues in 1975 were about $6 million. (Tr. 44).

Respondent uses a Cincinnati Shear in its operations for cutting steel plates to the required size. The shear has a 12-foot bed. (Tr. 8). (Exhs. C-1,2,3). The steel plating fed into the shear ranges from flat bar to wide plate 12 feet in width. Heavy items are handled by overhead crane. (Tr. 41). Respondent designed and manufactured a guard for the machine after consulting with manufacturers of shear machines. (Tr. 47). The guard utilized by respondent at the time of the inspection runs the length of the shear, resembling a grid or grate, consisting of horizontal tubes or bars connected at about one-foot intervals to vertical bars. The bottom bar floats free to a small degree in order to permit passage of different thicknesses of steel plate beneath it. Steel plate normally does not exceed 3/4" in thickness, but aluminum sheets up to 1-1/2" thick can be fed under the floating bottom bar. (Tr. 54). The opening between the bottom bar and the next higher bar is 1-3/8" high, and the corresponding distance between the middle bar and the upper bar is 1-5/8". The shearing blade is behind the bars, approximately 5-1/4" from the center line of the bars. Directly behind the bars are hold-down devices, in the form of

pedestals, which descend to hold the steel plate in place while the cutting operations are performed. These are located at about one-foot intervals, corresponding with the vertical bars. They are 1-5/8" behind the horizontal bars, and measure approximately 3" in diameter at the holding foot. (Stipulations - Tr. 9-17).

In operating the shear, the machine operator feeds the steel plate into the opening between the lower bar and the bed of the shear. He then steps on a treadle, which activates first the hold-down devices, descending to hold the plate, and then the shear blade for the actual cutting of the metal. (Tr. 18). Crane-assisted feeds ultimately result in the final guidance by the machine operator of the material into the machine. Because of the weight of some of the steel plates being cut, some bumping of material against the guard is inevitable. (Tr. 45,46).

Respondent also utilizes a Long and Allstatter hole punch in its operations. (Tr. 23). It punches holes in metal, and the bed can be lowered to a point where there is an opening of 1-1/2 inches between the male and female dies. (Tr. 26). No guard whatsoever was being used by respondent at the time of the inspection. The material fed into this machine varies from flat metal bars to angles, in various sizes. Sometimes a crane must be used to assist in feeding the material into the machine. It is foot-pedal operated, with the operator normally using both hands for positioning the material before striking the foot-pedal. (Tr. 61-67). (Exh. R-2).

## DISCUSSION AND CONCLUSIONS

It appears clear to me that respondent violated both of the considered standards in accordance with the charges contained in the citation. The guard it was using for protecting employees from the hazard presented by the shear machine was simply not adequate to prevent the accidental insertion of fingers, hands, or other parts of the body into the danger zones presented not only by the cutting blade of the shear, but the hold-down devices up forward of the blade. There is a difference in the hazards presented by the two, with the cutting blade being the far more dangerous, i.e., the high risk of amputation, but the crushing hazard presented by the hold-down pedestals is formidable in itself. Respondent contends that plexiglass coverings or curtains installed in front of the guard would be subject to scratch and other type injuries from the crane-fed plates, thus obscuring the vision of the machine operator with respect to the cut-line on the material. And it suggests that plexiglass is difficult to keep clean in a boiler shop, because of the generation of substantial dust. These are legitimate observations, but there appear to be other alternatives which have not been investigated fully by respondent, e.g., mesh wire, electronic trips, two-hand actuating buttons, etc. Economic feasibility has been over-emphasized by respondent, in my opinion, to the disadvantage of the safety factor. In any contest between the two, in the circumstances here shown, the latter must prevail. Largely the same reasoning applies to the hazard presented by the hole punch. Here, the violation is more patent, in that no guard of any kind was being utilized to prevent the operator from

accidentally inserting his finger between the two dies and suffering a pinching or crushing type of injury. Respondent contends that the material being fed into the hole punch machine fills the gap to such an extent that it effectively guards against any such injury. This may be true under certain circumstances, but there is no doubt in my mind that the machine operator is exposed to the hazard of an accidental injury at the point of operation before, during, and after the feeding of material into the machine. This contention must be rejected.

In view of all of the evidence of record, the material facts being essentially undisputed, it is specifically found that respondent was, on the cited date, in violation of the two safety standards here considered.

I further conclude that the violations were properly categorized as "serious" within the meaning of Section 17(k) of the Act (29 U.S.C. §666(j)).[1/] A finding of "seriousness" is not to be predicated upon the likelihood that an accident will occur, but upon the probability of serious harm should one occur.[2/] The probability of serious injury is clearly evident in the situations presented here.

The matter of the proposed penalties has been reviewed in the light of the four factors to be weighed under Section 17(j) of the Act (29 U.S.C. §666(i)), i.e., respondent's size, good faith, history of violations, and cooperativeness. The proposed penalties of $60 and $30 on Items 5 and 11 respectively are found to be proper in the circumstances shown.

---

1/ 29 U.S.C. §666(j) provides that a serious violation shall be deemed to exist if there is a substantial probability that death or serious physical harm could result from a condition, unless the employer did not, or could not, with the exercise of reasonable diligence, know of the presence of the violation.

2/ See Secretary v. Standard Glass & Supply Co. 2 OSAHRC 1488 (1973).

## CONCLUSIONS OF LAW

Upon the entire record, and consistent with the foregoing discussion and findings found therein, I conclude:

1. That the Review Commission has jurisdiction to hear and decide this cause.

2. That on March 8, 1976 respondent was in violation of the safety standard set forth at 29 C.F.R. 1910.212(a)(1), as charged under Item 5 of the citation issued on March 17, 1976.

3. That on the same date respondent was in violation of the safety standard set forth at 29 C.F.R. 1910.212(a)(3)(ii), as charged under Item 11 of the same citation.

4. That in both instances the violations found were "serious" within the meaning of 29 U.S.C. §666(k).

5. That, due consideration having been given the criteria set forth at 29 U.S.C. §666(i), civil penalties of $60 on Item 5, and $30 on Item 11 are reasonable and appropriate for the specified violations.

## ORDER

1. Items 5 and 11 of the citation are affirmed.

2. Civil penalties of $60 and $30, totaling $90, are hereby assessed against the respective violations.

So ORDERED.

DECISION

Before: ROWLAND, Chairman; CLEARY, Commissioner.[1/]

BY THE COMMISSION:

The Secretary of Labor alleges that Wenczel Tile Company ("Wenczel") violated several provisions of the asbestos standard at 29 C.F.R. § 1910.1001. The Secretary contends that an industrial talc, NYTAL 99, produced by the Intervenor, R. T. Vanderbilt Company, and used by Wenczel, contains asbestos fibers and that Wenczel was therefore required to affix caution labels to containers of NYTAL 99, monitor its workplace for asbestos fibers, and provide medical examinations for its employees exposed to airborne asbestos fibers. Administrative Law Judge Paul L. Brady found that NYTAL 99 contains asbestos fibers, but he vacated the citation upon finding that Wenczel did not and could not, with reasonable

---

*/ Commissioner Cottine took no part in the consideration or decision of this case.

diligence, have known of the presence of asbestos fibers in its workplace. The judge also found that the Secretary had not proven that Wenczel failed to monitor its workplace for asbestos fibers.

We adopt the judge's finding that asbestos fibers were present in the NYTAL 99 used by Wenczel. The judge properly weighed the evidence on this issue and his finding is supported by the preponderance of the evidence. We also conclude that the judge correctly found that Wenczel did not and could not, with reasonable diligence, know of the presence of asbestos in its workplace. We adopt the judge's reasoning on this issue.[1/] We note that, since the judge issued his decision, the Commission has reaffirmed its precedents holding that a citation cannot be affirmed absent proof that the employer did not and could not, with reasonable diligence, know of a violation. Prestressed Systems, Inc., 81 OSAHRC 43/D5, 9 BNA OSHC 1864, 1981 CCH OSHD ¶ 25,358 (No. 16147, 1981); General Electric Co., 81 OSAHRC 42/A2, 9 BNA OSHC 1722, 1981 CCH OSHD ¶ 25,345 (No. 13732, 1981).

We do not rule on the Secretary's contention that the principle of collateral estoppel cannot justify the vacation of the citation. The

---

1/ One year before the alleged violations in this case occurred, Wenczel had received citations alleging violations of the asbestos standard in another area of its plant. The earlier citations also arose out of Wenczel's use of NYTAL 99. The earlier citations were resolved in a settlement agreement, in which the Secretary agreed to delete all allegations that Wenczel violated the asbestos standard and Wenczel agreed to an amendment of the citation to allege that it had violated a standard regulating "fibrous talc." There is no indication in the record, and the Secretary does not suggest, that anything in the settlement negotiations or anything that transpired between the settlement agreement and the alleged violations in this case put Wenczel on notice that the Secretary continued to believe that NYTAL 99 contained asbestos despite his agreement to delete the asbestos standard allegations in the earlier citations. Judge Brady concluded that Wenczel was justified in relying on the settlement agreement and could not be found to have actual or constructive knowledge that asbestos was present in its plant.

judge did not rely on collateral estoppel, and the judge's basis for his disposition - that Wenczel did not and could not, with reasonable diligence, know of the presence of asbestos fibers - is factually correct and legally sufficient to support the judge's disposition. Additionally, because the citation is properly vacated on the knowledge issue, we need not decide whether the Secretary's evidence that Wenczel failed to monitor for asbestos fibers is sufficient.

Accordingly, the judge's decision is affirmed. SO ORDERED.

BRADY, Judge: This proceeding is brought pursuant to section 10 of the Occupational Safety and Health Act of 1970 (Act) to contest a citation and notification of proposed penalty issued June 10, 1977. It is alleged that as a result of an inspection of respondent's workplace located at 6608 South Westshore Boulevard, Tampa, Florida, respondent violated section 5(a)(2) of the Act by failing to comply with specific occupational safety and health standards promulgated by the Secretary pursuant to section 6 thereof.

The inspection on April 13-18, 1977, gave rise to issuance of the citation alleging violation of certain provisions under 29 C.F.R. 1910.1001 (the asbestos standard). Respondent is charged with failure to monitor its workplace to determine employee exposure to asbestos fibers, failure to affix caution labels on materials containing asbestos fibers, and failure to provide employees with medical examinations relative to asbestos exposure.

Due to the nature of the alleged violations it is first necessary to resolve the basic issue of whether asbestos was actually present in the workplace. Complainant maintains that bulk powder and filter membrane samples taken during inspection of the tile manufacturing facility, revealed the presence of asbestos fibers as defined by the standard. Respondent contends that through the methods and criteria employed, complainant has failed to accurately identify asbestos fibers for the purposes of this case.

A review of the evidence in this regard is therefore warranted. The record shows that during the inspection air samples were collected

through the use of a pump device which drew air over a filter membrane. Particles remaining on the membrane were subsequently analyzed. It is also shown that small quantities of raw materials gathered by the inspecting officer constituted the bulk powder samples.

The samples were analyzed by microscopic methods consisting of phase contrast microscopy, dispersion staining and transmission electron microscopy, including the application of selected area diffraction patterns, and x-ray dispersive analysis (Tr. 111-120, 281-284, Exhs. C-8 and C-11).

Phase contrast microscopy is the standard method of analysis for asbestos fibers. It is described as a form of of optical light microscopy which enables an analysist to ascertain the shape of fine particles including fibers. Used in combination with polarized light and first-order red retardation plates, a type of fiber can be further determined (Tr. 114-115).

Dispersion staining is an optical microscopic technique through which a mineral can be determined by suspending it in an immersion media that has a known index of light refraction, and observing the color that the substance emits (Tr. 115-117, 283-284 and Exh. C-11). Transmission electron microscopy uses a beam of electrons which highly magnifies a particle under examination and produces a selected area diffraction pattern. This can be used to determine the distance between planes of atoms which are characteristic of a particular material (Tr. 118-120, 281-282, 361, 363, Exh. C-11). The evidence

indicates x-ray dispersive analysis is used as an adjunct to the electron microscope. It results in the production of wave lengths or energy characteristic of the element present, and will in that capacity conclusively identify the mineral under examination (Tr. 118-120, 281-282, Exh. C-11).

Mr. Willard Dixon, an expert in optical microscopy, analyzed bulk samples using the dispersion staining method and determined that fibers of tremolite and anthophyllite were present in samples identified as A3805, A3806, A3807 (Tr. 132-144, Exh. C-8). Mr. Dixon also analyzed filter samples using the phase contrast method and found the presence of asbestos fibers on filter sample nos. A3751-A3778 (Tr. 130-132, 145, 149, Exh. C-9). His analysis of the filter samples confirmed the presence of fibers as found by another analyist (Tr. 130-132, 158-159, Exhs. C-7 and C-9).

Mr. Ian Stewart, an expert in the field of electron and optical microscopy, also analyzed both types of samples (Tr. 161-162, 290, Exh. C-11). Through electron microscopy with selected area diffraction and x-ray dispersive analysis he found asbestos fibers present on bulk samples A3805 and A3807 (Tr. 236, 239, Exh. C-11). This same method performed on filter samples A3754 and A3753, also revealed the presence of asbestos fibers (Tr. 354, 358, Exh. C-11). Dispersion staining performed on bulk samples A3805-A3807, and on the filter samples A3761 and A3776 resulted in Mr. Stewart finding asbestos fibers (Tr. 324, 326, 334, 339, Exh. C-11).

In spite of respondent's contention of unreliable analyses, and questionable results, complainant's two expert witnesses testified that analyses conclusively showed the presence of anthophyllite and tremolite asbestos fibers, within the meaning of the asbestos standard (Tr. 268, 326-327, 345-346). Therefore, it is argued by complainant that between April 13 and April 18, airborne asbestos fibers were present at respondent's workplace.

Respondent's primary thrust was directed toward establishing complainant's failure to adequately determine whether the samples in question contained asbestos fibers or talc fibers within properly defined terms. The record clearly reflects the problems associated with analyzing samples for asbestos, and the difficulty in distinguishing asbestos fibers from talc fibers due to great similarities.

Witness Dixon admitted that fibers counted on the membrane included both talc and asbestos, and the percentage figure captioned "asbestos" on the filter paper contained talc (Tr. 246-248). It was also admitted that with use of dispersion staining the mineral wollastonite would stain the same color as tremolite. Also, the x-ray diffraction technique was not performed which could have revealed whether wollastonite was present. In his expert opinion, however, the witness did not believe wollastonite was identified as anthophyllite (Tr. 252-253).

Witness Stewart admitted that with the amphibole identification used, the mineral cummingtonite could have been reflected in the

testing, but further analysis convinced him of the presence of anthophyllite (Tr. 358, 363).

Respondent points out that the dispersion staining analysis performed by Dixon found the presence of tremolite asbestos in samples A3805 and A3807, while Stewart testified that using electron microscopy he found anthophyllite but was not conclusively able to find tremolite fibers in the samples (Tr. 326). It is therefore argued that either or both findings are faulty and lacking in credibility.

The record in this case attests to the considerable effort expended by the parties in attempting to establish the presence of asbestos fibers on one hand, and denying the fibers present were actually asbestos on the other. In addition, respondent attacks the asbestos standard and the definitions used thereunder.

"The standard does not state a method for determining the mineralogical composition of fibers found in a sample." Also, the type methods used by the Secretary in analyzing the samples for asbestos fibers have been held acceptable by the Commission. The Commission has also noted that its function does not include reviewing the wisdom of a standard wherein certain minerals are regulated as asbestos. See Secretary v. Borg Warner, Docket No. 10757, 78/18/A2 (February 22, 1978).

The aspect of this case relating to the presence of asbestos is resolved by the testimony of the Secretary's two expert witnesses.

They found, through acceptable methods of analyses that the samples contained asbestos fibers within the definition of the standard. The unrebutted conclusions of the experts must prevail, in spite of respondent's strenuous efforts to impune the methods employed in arriving at such conclusions.

While most of the evidence and discussion concerning analyses of samples used to determined the presence of asbestos fibers, it must be noted that respondent was not charged with exposing employees to excessive levels thereof. The violations alleged pertain to other sections of the asbestos standard.

ALLEGED VIOLATION OF 29 C.F.R. 1910.1001(f)(1)

The standard, which pertains to initial determination of asbestos fibers, provides in pertinent part as follows:

> Within 6 months of the publication of this section, every employer shall cause every place of employment where asbestos fibers are released to be monitored in such a way as to determine whether every employee's exposure to asbestos fibers is below the limits prescribed . . .

It is alleged in the citation that initial monitoring was not conducted in the tile press, and tile inspecting areas at the plant.

The evidence of the violation was based on the inspecting officer's testimony that he was not made aware of any monitoring by the employer, although he did request such information (Tr. 92).

It must necessarily be held that this testimony standing alone is insufficient to prove that no monitoring took place in violation of the clear provisions of the standard. Complainant,

therefore, failed to carry its burden in proving no monitoring occurred, as the burden in no way shifts to respondent to prove otherwise.

The clear language of the standard presupposes that asbestos fibers are released in the workplace. The question, therefore, arises as to what constitutes sufficient notice to an employer that his place of employment comes within the scope of the standard, and thus should undertake the required monitoring. In this regard another point must be considered in the decision of this case.

A citation was previously issued respondent on April 14, 1976, alleging certain violations under the asbestos standard including those that are the subject of this proceeding (Exh. R-9). Subsequently, the parties entered into a settlement agreement which provided for deletion of all allegations respondent violated any provisions of the asbestos standard at its workplace, and substituted therefor was respondent's failure to reduce ceiling limits of fibrous talc to permissible levels, in violation of 29 C.F.R. 1910.1000 (Exh. R-10). Respondent withdrew its notice of contest under the terms of the agreement and was allowed a period of one year from the date of the final order to achieve compliance with the standard.

The testimony in the instant case reveals that subsequent to the settlement agreement, the Occupational Safety and Health Administration (OSHA) changed its policy, and inspecting officers were directed to sample materials such as talc, under certain conditions,

for asbestos. The directive indicated it was temporary in nature and part of an on-going study (Exh. R-2, Tr. 77 and 93).

Although it is contended the present inspection was conducted at a different part of the plant, the inspection concerned the talc ingredient of respondent's tile manufacturing process. Clearly at the time of the inspection the same raw materials and work practices were employed at the workplace.

Complainant therefore charged respondent under the same standard on two different occasions, arbitrarily subjecting respondent to varying interpretations of its standards. The facts involved are not unlike those where the doctrine of equitable estoppel should apply. Based upon the previous contractual dealings between the parties, respondent relied upon the complainant (to its detriment in withdrawing the notice of contest), and now complainant proceeds to hold it responsible for compliance under the same standard that respondent was previously led to believe did not apply.

There is no evidence that respondent had knowledge of the alleged violative conditions prior to the inspection, or with the exercise of reasonable diligence should have known. Knowledge of the existence of a violation, either actual or constructive, is an essential element of any violation of the Act. Secretary v. Mountain States Telephone & Telegraph Co., 2 OSAHRC 168 (1972), Dunlop v. Rockwell International, 54 F.2d 283 (6th Cir. 1976).

The stated purpose of the Act is to provide working men and women safe and healthful working conditions "so far as possible".

Section 5(a)(2) thereof requires that each employer "shall comply with occupational safety and health standards promulgated under this Act". Respondent herein has been in compliance with the standard it had been led to believe was controlling pursuant to agreement of the parties. Further, employees were required to use respirators for their protection during the interim period of compliance, which was in effect at the time of the second inspection.

In reference to an employer's duties under the Act, the Court in Rockwell, supra, 1291-1292, stated as follows:

> Employers are to be stimulated to institute new safety programs and improve such existing programs. The Act envisions cooperative efforts between employers, employees, researchers, and federal and state safety officials. Voluminous regulations have been prolumgated or adopted pursuant to the Act. An employer's task in attempting to comply with these regulations is formidable. It seems clear that the Act was meant to compel employers to thoroughly scrutinize their places of employment in an effort to locate and remedy hazardous conditions. . . . The employer's task is difficult enough without adding responsibility for potentially hazardous circumstances of which the employer is unaware and could not discover with the exercise of reasonable diligence. . . . The Act asks employers to make a reasonable and a diligent effort to comply with safety standards, neither the Secretary, the Commission, nor this Court can hold an employer to a higher standard.

In view of the foregoing, that part of the citation alleging violation must be vacated.

ALLEGED VIOLATION OF 29 C.F.R. 1910.1001(g)(2)(1)

The standard, which applies to caution labels, states in pertinent part as follows:

> Caution labels should be affixed to all raw materials, mixtures, scrap, waste, debris, and other products containing asbestos fibers. . .

It is alleged in the citation that caution labels as required by the standard were not affixed in the bag-pallet storage area and on portable waste bins in the tile press area. The complainant asserts that this standard becomes operative when fibers of asbestos are present in the materials which are used and handled in the work process. The testimony of the inspecting officer indicated the labeling provision of the asbestos standard was violated because there was no asbestos type labels placed on the raw materials.

Again, prior to the inspection respondent was without knowledge of the presence of asbestos in the workplace. In addition, the previous settlement agreement was in effect, which pertained to the same work practices and involved the same raw materials. Therefore, it cannot be held that with the exercise of reasonable diligence respondent should have known of the alleged violative conditions.

ALLEGED VIOLATION OF 29 C.F.R.
1910.1001(j)(2), (j)(3) AND (j)(4)

The pertinent parts of the above standards are set forth as follows:

> (2) Preplacement. The employer shall provide or make available to each of his employees, within 30 calendar days following his first employment in an occupation exposed to airborne concentrations of asbestos fibers, a comprehensive medical examination. . .

(3) Annual examinations. On or before January 31, 1973, and at least annually thereafter, every employer shall provide, or make available, comprehensive medical examinations to each of his employees engaged in occupations exposed to airborne concentrations of asbestos fibers. . .

(4) Termination of employment. The employer shall provide, or make available within 30 calendar days before or after the termination of employment of any employee engaged in an occupation exposed to airborne concentrations of asbestos fibers, a comprehensive medical examination. . .

It is alleged in the citation that the above standards were violated in the tile press area, and tile inspecting area involving tile press operators, floor clean-up men, and tile inspectors. The record is lacking in evidence upon which the violations can be sustained. The foregoing discussion with reference to this employer's knowledge of alleged violative conditions is likewise applicable here. Also it must be held that complainant has failed to prove the essential elements to establish the violations alleged.

The citation must therefor be vacated.

On June 30, 1978, respondent filed a motion to reopen the record on the basis of newly discovered evidence, and a motion to dismiss certain items of the citation.

The basis of the motion to reopen is a document captioned "Asbestos Fibers in the Air, Occupational Safety and Health Administration, Analytical Method" which is indicated as being newly discovered, and contains a different definition of asbestos from the definition contained in 29 C.F.R. 1910.1001. The document, issued May 5, 1977,

reflects on its face that it is a draft -- subject to revision, and not to be quoted or cited.

In addition to the document, and attached to the motion is a copy of a deposition for use in another case. The deponent, Director of the Analytical Laboratory in Salt Lake City, stated the purpose of the document is to provide wirtten direction for phase contrast analysis of asbestos fibers in air, and agreed that the definition of asbestos contained therein differed from the one in the Federal Register. Also, he indicated that within the laboratory, Mr. Willard Dixon has the overall responsibility for analyzing asbestos.

Respondent contends that the exhibits in support of its motion reinforces its view that the asbestos standard is unconstitutionally vague.

The documents upon which respondent's motion is based further points up the various changes in guidelines and interpretations employed by complainant in the analysis of asbestos fibers.

Certainly from a regulatory standpoint, employers are entitled to more precisely know at any given time, what is being regulated, and how it is being regulated, within the purview of a standard. However, the matters raised in the motion are not sufficient to warrant reopening the record.

It is noted that the document in question did not change any practices or policies at the laboratory prior to May 18, 1977. Further, Mr. Willard Dixon, testified in the instant case as to his

conclusive findings within the context of the asbestos standard as written.

Having read and considered respondent's motions, it must be held that the matters raised would not materially affect a decision on the issues, and are therefore denied.

FINDINGS OF FACT

1. Wenczel Tile Company of Florida, Inc., is a corporation having a place of business and doing business at 6608 South Westshore Boulevard, Tampa, Florida, where at all times hereinafter mentioned it is engaged in the manufacture of tiles and it receives goods and materials manufactured outside the State of Florida.

2. On April 14-18, 1977, authorized representatives of the Secretary conducted an inspection of respondent's workplace. As a result of the inspection, a citation was issued June 10, 1977, with notice of proposed penalties.

3. On February 17 and 18, 1976, duly authorized representatives of the Secretary conducted an inspection of respondent's aforesaid workplace, which resulted in the issuance of a citation alleging violation of the same standards as in the instant case.

4. On September 15, 1976, the parties entered into a settlement agreement, which was approved by the Commission, wherein all allegations of violations under the asbestos standard were withdrawn.

5. Subsequent to the agreement, and while it was in effect, the Secretary initiated a change of procedure regarding inspections for asbestos.

6. The inspection commencing April 14, 1977, revealed the presence of tremolite and anthophyllite asbestos in materials used in respondent's workplace, even through the type of raw materials and work practices had not changed between February 18, 1976, and April 18, 1977.

7. Respondent was without notice that materials used in the workplace contained asbestos fibers.

CONCLUSIONS OF LAW

1. Wenczel Tile Company of Florida, Inc., at all times pertinent hereto, was an employer engaged in a business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970, and the Commission has jurisdiction of the parties and subject matter herein, pursuant to section 10(c) of the Act.

2. Respondent is and at all times pertinent hereto, required to comply with safety and health regulations promulgated by the Secretary pursuant to section 6(a) of the Act.

3. On April 14-18, 1977, respondent was not in violation of the standards at 29 C.F.R. 1910.1001(f)(1), 1910.1001(g)(2)(1), 1910.1001(j)(2), 1910.1001(j)(3) and 1910.1001(j)(4).

Upon the basis of the foregoing findings of fact and conclusions of law, and the entire record, it is

ORDERED: That the citation and proposed penalty are hereby vacated.

Dated this 14th day of August, 1978.

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

This case is before the Commission for review under 29 U.S.C. § 661(i), section 12(j) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). The Secretary of Labor ("the Secretary") issued citations to the Respondent, Pittsburgh Forgings Company ("Pittsburgh"), alleging violations of the Act. Administrative Law Judge William E. Brennan vacated several items of the citations because the Secretary failed to comply with the judge's order to produce documents. The issue on review is whether the judge abused his discretion in resorting to the sanction of vacation under the circumstances here.

I

On May 5, 1978, Pittsburgh filed a motion for a more definite statement under Federal Rule of Civil Procedure 12(e) and Commission Rule 33(a)(2), 29

C.F.R. § 2200.33(a)(2); it also filed a broad request for the production of documents under Federal Rule of Civil Procedure 34. 1/ The judge granted the motion for a more definite statement. 2/ After more than three weeks elapsed without the filing of a more definite statement by the Secretary, Pittsburgh moved to strike items 1 and 2 of citation 1 under Federal Rule of Civil Procedure 12(e). The Secretary responded that his failure to file a more definite statement was "inadvertent and due to an inordinarily heavy workload." The response was accompanied by the Secretary's more definite statement. The judge denied Pittsburgh's motion to strike. The judge accepted the Secretary's reasons for his late filing but admonished the Secretary that "future failures to comply with Review Commission orders will not be tolerated."

As to the request for the production of documents, the Secretary had 30 days in which to respond under Federal Rule 34. When there was no response within 30 days, Pittsburgh's counsel contacted the Secretary's counsel to ascertain when the Secretary would respond. Pittsburgh's counsel represented to Judge Brennan that the Secretary's counsel said that he would reply to the request during the following week. The Secretary's counsel stated that he told Pittsburgh's counsel that he would respond to the request; it is unclear whether the Secretary's counsel indicated a date by which he would respond. When the Secretary's response was three weeks overdue, Pittsburgh filed a motion to compel production. The judge concluded that Pittsburgh had shown good cause

---

1/ Commission Rule 2(b), 29 C.F.R. § 2200.2(b), states that "[i]n the absence of a specific provision, procedure shall be in accordance with the Federal Rules of Civil Proceudre." See also section 12(g) of the Act, 29 U.S.C. § 661(f).

2/ The judge did not mention how long the Secretary had to respond to the motion, but under Fed. R. Civ. P. 12(e) the Secretary must respond within 10 days unless the judge states otherwise.

and ordered the Secretary to mail the requested documents to Pittsburgh no later than July 19, 1978.

On July 17, 1978, the Secretary responded to the judge's order by providing to Pittsburgh OSHA Form 1, OSHA Form 1A, OSHA Form 1(B) (inspection forms and worksheets), several pages of the National Safety Council, Accident Prevention Manual for Industrial Operations, and three photographs taken by the compliance officer during the inspection.

On July 21, 1978, Pittsburgh filed a motion for sanctions against the Secretary on the ground that the Secretary's submissions were incomplete; the motion was made under Commission Rule of Procedure 54, 29 C.F.R. § 2200.54, and Federal Rule 37(b). 3/ In particular, Pittsburgh noted that the Secretary, without explanation, did not submit the following requested documents:

> [T]he compliance officer's field notes, contemporaneous drawings, relevant memoranda, statements of third parties, documents, photographs and memoranda connected with the 1975 citation which gave rise to the alleged repeat citation, and other documents which might be within any of the seven numbered paragraphs of [Pittsburgh's] Request but which are unknown to [Pittsburgh] due to [the Secretary's] failure to tender a proper formal response.

Pittsburgh proposed that the judge vacate all citations or, in the alternative, vacate those items that Pittsburgh had abated.

At a hearing on the motion for sanctions, Pittsburgh presented testimony that some items had been abated. The compliance officer testified that he

---

3/ Commission Rule 54 provides:

> Rule 54 Failure to comply with orders for discovery.
>
> If any party or intervenor fails to comply with an order of the Commission or the Judge to permit discovery in accordance with the provisions of these rules, the Commission or the Judge may issue appropriate orders.

Federal Rule 37(b) permits a judge to impose sanctions, including dismissal of all or part of an action, when a party does not obey a discovery order.

destroyed his field notes after he copied them verbatim onto OSHA worksheets, and that only three of five photographs taken during the inspection came out. The Secretary's counsel also presented to Pittsburgh the original employee complaint and an inspection report relating to a prior citation.

In the judge's decision, he stated that the Secretary had been warned in the judge's order compelling the production of documents that "future failures to comply with Review Commission orders will not be tolerated." Yet, when the Secretary filed its documentary submissions, the Secretary did not "explain why certain of the requested items had not been provided." The judge noted that because the Secretary did not comply with Pittsburgh's requests, Pittsburgh was harmed because it had to bear the expenses of filing motions to compel discovery. The judge stated that the Secretary's "[failure] to properly deny possession of documents" prejudiced Pittsburgh because it substantially hindered Pittsburgh's trial preparation. The judge concluded that a partial sanction vacating abated items was proper because it furthered orderly administrative proceedings and protected a party's rights to full discovery.

On review, the Secretary argues that the judge's sanction is inappropriate. He maintains that the judge erred in finding that the late submission of documents prejudiced Pittsburgh's preparation of its case. The Secretary cites Rollins Outdoor Advertising, Inc., 77 OSAHRC 24/C1, 5 BNA OSHC 1041, 1976-77 CCH OSHD ¶ 21,311 (No. 12528, 1977), for the proposition that an employer must have been prejudiced for a judge to impose the extreme sanction of vacation.

Pittsburgh argues first that it was prejudiced because the Secretary's derelictions "severely hampered" its trial preparation. It claims that resources it would have devoted to trial preparation were instead diverted to obtaining withheld documents. It also points to the expense it bore in attempting to enforce its discovery rights.

Pittsburgh argues that even if it had not been prejudiced, the judge properly exercised his discretionary power "to protect the integrity of Commission orders." Pittsburgh notes that despite the judge's admonition that he would not tolerate further failures to comply with his orders, the Secretary without explanation took eleven weeks to respond to the request for production of documents, failed to include documents associated with the 1975 citation, failed to produce the complaint that gave rise to the inspection, and failed to supply the compliance officer's original field notes.

Pittsburgh argues that the judge properly used the sanction of dismissal to deter future flouting of court orders. Pittsburgh also maintains that the Secretary's argument that the judge imposed the most severe sanction is overstated because Judge Brennan vacated only those items that had been abated.

II

The issue here is not whether we agree with the judge's action, but whether the judge abused his discretion in vacating the items under the circumstances in this case. See Duquesne Light Co., 81 OSAHRC 71/E7, 8 BNA OSHC 1218, 1221, 1980 CCH OSHD ¶ 24,384, p. 29,718 (Nos. 78-5034, 78-5112 & 78-5303, 1980) (enforcement of pre-hearing order). In Duquesne, the Commission held that because vacation of a citation is an extreme sanction that frustrates the remedial purpose of the Act, it should generally not be imposed unless prejudice or contumacious conduct is found. Duquesne is not controlling here, however. There was no showing in Duquesne that the allegedly violative conditons had been abated; indeed, the Commission and the judge assumed that the cited conditions continued to exist. See 8 BNA OSHC at 1219, 1220, 1980 CCH OSHD at pp. 29,716, 29,717. It was largely for that reason that the Commission was of the view in Duquesne that vacation "would frustrate the remedial purposes of the Act." 8 BNA OSHC at 1222, 1980 CCH OSHD at p. 29,719. Here, however, Pittsburgh has shown that some cited

conditions have been abated and the judge vacated only the corresponding items of the citations. This is a less severe sanction than that considered in Duquesne.

We are unconvinced that Judge Brennan abused his discretion. The Secretary's conduct disrupted the discovery process. After the Secretary made a late response to a motion for a more definite statement, the judge excused his behavior, but also placed the Secretary on notice that the judge would not tolerate further failures to comply with his orders. Yet, the Secretary did not comply with a subsequent request for the production of documents, thereby making it necessary for the judge to issue an order compelling their production. Even then, the Secretary without explanation failed to provide all requested documents in a timely manner.

Judge Brennan acted to preserve the integrity of Commission orders as well as to deter future misconduct by the Secretary. The judge's concerns were proper. See National Hockey League v. Metropolitan Hockey Club, 427 U.S. 639, 642-643 (1976). There are public interests in adjudicating cases on their merits, in issuing binding abatement orders and in assessing penalties to deter future violations of the Act. However, there is also a substantial public interest in orderly procedure. See Consolidated Freightways, 81 OSAHRC 46/E9, 9 BNA OSHC 1822, 1827, 1981 CCH OSHD ¶ 25,369, p. 31,573 (No. 79-3136, 1981). We cannot say that the balance Judge Brennan struck between those interests fell outside the range of his discretion.

Accordingly, the judge's decision is affirmed.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: MAR 24 1982

COTTINE, Commissioner, dissenting:

This case demonstrates once again that poor practice invites precipitous judgment. See TRG Drilling Corp., 10 BNA OSHC 1268, 1982 CCH OSHD ¶25,837 (No. 80-6008, 1981) (Cottine, Commissioner, dissenting). I do not condone the poor practice by the Secretary's counsel in this case. However, Commission precedent is clear: "We have held that dismissal is too harsh a sanction for failure to comply with a discovery order unless the record shows contumacious conduct by the noncomplying party or prejudice to the party seeking discovery." Noranda Aluminum, Inc., 80 OSAHRC 128/B2, 9 BNA OSHC 1187, 1189, 1981 CCH OSHD ¶25,085, p. 30,988 (No. 79-1059, 1980), appeal dismissed, 650 F.2d 934 (8th Cir. 1981), citing Duquesne Light Co., 80 OSAHRC 32/B7, 8 BNA OSHC 1218, 1980 CCH OSHD ¶24,384 (No. 78-5034, 1980). Also Newport News Shipbuilding and Drydock Co., 80 OSAHRC 119/A2, 9 BNA OSHC 1085, 1980 CCH OSHD ¶25,003 (No. 76-171, 1980); TRG Drilling Corp., supra. Yet, in this case the majority upholds dismissal without even mentioning contumacious conduct or prejudice.

I

Without explanation the majority has restruck the balance forged in the Duquesne line of cases between the Commission's interest in orderly proceedings and the public's interest in a final decision on the hazardousness of the cited working conditions. Moreover, in affirming a judge's ad hoc exception to Commission precedent, the majority broadly authorizes the ad hoc balancing of interests whenever dismissal is urged as a sanction for one party's failure to comply with procedural rules or discovery orders. As a consequence, unqualified discretion has been delegated because no rule of law guides its exercise.

The silent abandonment of precedent in this case is unfortunate because the Duquesne line of cases weighed the competing interests in the manner most consistent with the remedial purposes of the Act. See Whirlpool Corp. v. Marshall, 445 U.S. 1 (1980); Southern Pacific Transportation Co. v. Usery, 539 F.2d 386 (5th Cir. 1976), cert. denied, 434 U.S. 874 (1977); Brennan v. Southern Contractors Service, 492 F.2d 498 (5th Cir. 1974); Brennan v. OSHRC (Gerosa, Inc.), 491 F.2d 1340 (2d Cir. 1974). A decision on the merits of a citation, including a determination of the proper abatement requirements and appropriate penalties, directly serves the basic purposes of the Act in achieving the abatement and prevention of hazardous working conditions. See 29 U.S.C. §§651(b), 659(c). Certainly, orderly procedure is important to the efficient administration of the Act. However, the Act's remedial purposes necessarily require the balance to favor a decision on the merits of a citation in fairness to employers and employees alike.

The Respondent's representation that the items involved have been abated provides an insubstantial basis to distinguish this case from our precedent. The Act's central objective is to prevent workplace hazards, not simply to obtain abatement of existing hazards. See Farmers Export Co., 80 OSAHRC 66/A2, 8 BNA OSHC 1655, 1980 CCH OSHD ¶24,569 (No. 78-1708, 1980)(Cottine, Commissioner, dissenting). The prevention of hazards and the promotion of future compliance is served by an order disposing of alleged violations on their merits, including appropriate penalties and the statutory characterization of the violations, e.g., willful, repeated, serious, or nonserious. Denying the Secretary the opportunity to pursue these basic aspects of enforcement merely because the conditions have been abated is inconsistent with the statute and Commission case law. See, e.g., P.A.F. Equipment Co., 79 OSAHRC 18/A2, 7 BNA OSHC 1209, 1979 CCH OSHD ¶23,421 (No. 14315, 1979), aff'd, No. 79-1398 (10th Cir. Dec. 2, 1980).

II

The majority has not attempted to justify its affirmance of the judge's decision on any grounds of contumacious conduct by the Secretary's counsel or prejudice suffered by the Respondent.[1/] Although the judge found prejudice, that finding was not properly supported. The noncompliance with discovery requirements by the Secretary's counsel certainly was unjustified and regrettable.[2/] However, the record fails to sustain the judge's finding that the Secretary's noncompliance "substantially hindered Respondent in the preparation of its case."[3/]

---

1/ The Respondent has not expressly argued that the conduct of the Secretary's counsel was contumacious and the record does not support such a finding. In particular, the Respondent has not substantiated its claim that the representations of the Secretary's counsel as to the field notes were intentionally misleading.

2/ There are lesser sanctions than dismissal available and these have not been shown to be inadequate here. For example, the judge could have prohibited the introduction of evidence based on certain documents. See Fed.R.Civ.P. 37(b)(2). A stay of the proceedings or a continuance would cure any surprise from late disclosure. See Id.

3/ To the extent that the judge may have relied on "the expense and inconvenience of filing motions to compel disclosure" as a ground for dismissal, these considerations alone do not constitute legal prejudice in this context. Legal prejudice resulting from an opponent's noncompliance with rules or orders arises when a party is denied a fair hearing on the merits. Accu-Namics, Inc., 74 OSAHRC 35/A2, 1 BNA OSHC 1751, 1974-74 CCH OSHD ¶17,936 (No. 477, 1974), aff'd, 515 F.2d 828 (5th Cir. 1975).

The Respondent's reliance on Hoerner Waldorf Corp., 76 OSAHRC 135/D12, 4 BNA OSHC 1836, 1976-77 CCH OSHD ¶21,215 (No. 12713, 1976), is misplaced. Assuming that the Commission majority's one-sentence affirmance of the judge's decision in that case can be read to adopt his rationale, the judge based his dismissal on a finding of prejudice from surprise testimony, not merely expense or inconvenience to the Respondent. Furthermore, Fed.R.Civ.P. 37 does not establish that the expense and inconvenience of filing motions to compel discovery constitutes legal prejudice. Cf. 8 Wright & Miller, Federal Practice and Procedure §2293 (1970).

In support of its argument that it was prejudiced, the Respondent points to four categories of documents that the Secretary's counsel failed to either disclose or explain his nondisclosure prior to the hearing on the sanctions motion. These were: (1) the original employee complaint on which the inspection was based; (2) the file on a previous citation that was the basis of the repeat citation; (3) two photographs that the compliance officer testified did not develop; and (4) the compliance officer's original field notes. As to the first three categories, the Respondent did not satisfy its burden of proof regarding actual prejudice.

First, the transcribed version of the original employee complaint had been disclosed to the Respondent during the inspection though the employee's name had been deleted as permitted under 29 U.S.C. §657(f)(1). The Secretary's counsel represented that the employee had not waived confidentiality until the morning of the sanctions hearing. The Respondent has made no showing that earlier disclosure of the employee's name should have been required. See Massman-Johnson (Luling), 80 OSAHRC 44/B8, 8 BNA OSHC 1369, 1980 CCH OSHD ¶24,436 (No. 76-1484, 1980).

Second, the repeat citation was vacated on the merits. Therefore, no prejudice results from late disclosure of the file on the earlier violation.

Third, there is no dispute that the two photographs in question did not develop. No prejudice results from their nondisclosure.

As to the final documents, the compliance officer testified that he transcribed his original field notes onto standard worksheets (OSHA Form No. 1B) that had been disclosed to the Respondent. In addition, the compliance officer testified that his notes were in a "dirty, greasy" condition

and that they were destroyed when they were transcribed onto the worksheets. He further testified that the transcribed version was essentially the same as the field notes with the exception of punctuation and editorial changes to make the notes more readable. He stated that among the changes there was "nothing that would affect the case." The Respondent submitted no evidence questioning the credibility of the compliance officer's testimony. In addition, there is no evidence that the compliance officer negligently transferred the data or acted in bad faith. Thus, the Respondent has not affirmatively shown any prejudice to its case from the destruction of the field notes.

As in this case, the compliance officer is frequently the only witness for the Secretary and in most other cases the compliance officer is the principal witness for the Secretary. The purpose of disclosure on request at the hearing of all statements in the government's possession relating to the direct testimony of the Secretary's witnesses is to provide the Respondent with "an opportunity for full and effective cross-examination of each witness. This includes an opportunity to test the veracity and accuracy of a witness's testimony against prior statements by that witness on the same subject." Massman-Johnson, supra, 8 BNA OSHC at 1376, 1980 CCH OSHD at p. 29,808. This opportunity should extend to all notes relating to the subject matter of the direct testimony of any witness for the Secretary when the notes have been in the government's possession at any time. This includes rough or initial notes of a compliance officer who testifies.

Moreover, sanctions for nondisclosure based on loss of evidence should be imposed in the future unless the government can show that it has promulgated, enforced and attempted in good faith to follow rigorous

and systematic procedures designed to preserve all documentary material related to the Secretary's witnesses. See United States v. Harrison, 524 F.2d 421, 422 n. 1 (D.C. Cir. 1975), quoting United States v. Bryant, 439 F.2d 642, 652 (D.C. Cir. 1971).[4/] However, the Secretary and the compliance officer were not on notice that sanctions were in order for failure to retain rough field notes of an OSHA inspection after they were faithfully transcribed onto OSHA worksheets.[5/]

---

4/ In criminal prosecutions, the courts are divided on whether sanctions are appropriate when government agents destroy rough notes from which witness statements or reports are prepared. Compare, e.g., United States v. Hurst, 510 F.2d 1035, 1036 (6th Cir. 1975), and U.S. v. Lieberman, 608 F.2d 889, 895-96 & n. 13 (1st Cir. 1979), with United States v. Carrasco, 537 F.2d 372, 376-79 (9th Cir. 1976), and United States v. Harrison, supra. In Killian v. United States, 368 U.S. 231, 242 (1961), the Supreme Court held that no sanctions were appropriate where an FBI agent destroyed rough notes of certain oral reports of expenses by a paid informant after transferring the information onto receipts that subsequently were signed by the informant. The case was distinguished in Harrison: "We cannot accept the notion that in focusing on such an unimportant category of evidence as this, the Supreme Court was announcing doctrine meant to cover even notes of substantive statements given by important witnesses." United States v. Harrison 524 F.2d at 432, n. 33. The Harrison court also stated that in Killian the important fact relevant to the informant's credibility was already established by the existing evidence -- that he was a well-paid government informant.

5/ The Respondent asserts that the compliance officer was on notice that failure to retain the field notes could result in sanctions. However, the Commission has not ruled specifically on the extent of the Secretary's duty to retain preliminary field notes of its compliance officers. In our earlier cases we have ruled only that where the compliance officer testifies at the hearing on the merits, the Secretary generally is required to disclose on request the compliance officer's notes and memoranda that are in the government's possession. E.g., Massman-Johnson, supra; Frazee Construction Co., 73 OSAHRC 34/B5, 1 BNA OSHC 1270, 1973-74 CCH OSHD ¶16,409 (No. 1343, 1974). Thus, the Secretary and his representatives have not previously been on notice that there is an affirmative duty to preserve preliminary OSHA field notes for possible civil litigation after they were faithfully transcribed onto worksheets. Accordingly, there is no burden on the Secretary in this case to show that no prejudice resulted from destruction of the field notes.

In the absence of an affirmative duty in the investigation and preparation of this case to preserve the original field notes, the balancing test of United States v. Harrison is properly applied to determine whether sanctions are appropriate. The Commission "should weigh the degree of negligence or bad faith involved, the importance of the evidence lost, and the evidence of [violations] adduced at trial in order to come to a determination that will serve the ends of justice." 524 F.2d at 434, quoting United States v. Bryant, 439 F.2d at 653. Certainly, the compliance officer's testimony is crucial to this case. However, there is no evidence of any negligence or bad faith. Moreover, there is the unrebutted testimony of the compliance officer that there were no differences between the field notes and the OSHA worksheets disclosed to the Respondent "that would affect the case." The compliance officer has not been found to lack credibility in any respect. Furthermore, there is no evidence regarding the alleged violations to consider in determining the appropriateness of sanctions because no hearing was held. On balance, no sanctions are appropriate and the judge abused his discretion in granting the motion to dismiss.[6/] As a consequence, I would reverse his decision and remand the case for a determination of the merits.

---

6/ In choosing among sanctions, the judge is to select a lesser sanction than dismissal if it will remedy the noncompliance. See Duquesne Light Co., supra; Massman-Johnson, supra, 8 BNA OSHC at 1380 & n. 14, 1980 CCH OSHD at p. 29,809-10 & n. 14. See generally Commission Rule 54, 29 C.F.R. §2200.54.

Scott J. Wenner, Esq.

Brennan, W. E., A.L.J.

STATEMENT OF THE CASE

This case arises under Section 10(c)[1] of the Occupational Safety and Health Act (the Act).[2] Involved are various citations issued pursuant to Section 9(a)[3] of the Act by the Secretary of Labor through the Area Director of the Occupational Safety and Health Administration for Philadelphia, Pennsylvania (Complainant) to Pittsburgh Forgings Company (Respondent) at Respondent's plant in Coraopolis, Pennsylvania. Remaining at issue are three Items of a Nonserious Citation and a single Repeat Citation.[4] A Nonserious Citation (OSHRC Docket No. 78-2041) issued after a second inspection of Respondent's plant was consolidated for hearing by order of June 30, 1978 (R.p. J-4).[5] Complainant proposed penalties totalling $980 for the alleged violations.[6]

1/ 29 U.S.C. 659(c).

2/ 29 U.S.C. 651 et seq.

3/ 29 U.S.C. 658(a).

4/ Originally, a three-Itemed Serious Citation, a single-Itemed Repeat Citation and a nine-Itemed Nonserious Citation were issued. At the hearing, partial sanctions were imposed under which Items 2 and 3 of the Serious Citation and Items 2, 3, 5, 6, 8 and 9 of the Nonserious Citation as well as the proposed penalties were vacated (see p. 3, note 8 infra). At the close of Complainant's case in chief, Item 1 of the Serious Citation was dismissed because Complainant failed to establish a prima facie case that a "recognized hazard" existed (see P. 5, note 9 infra).

5/ References herein translate as follows:

| R.p. 3 | The third numbered document in the official Docket File prior to assignment to the undersigned. |
| R.p. J-3 | The third numbered document in the official Docket File after assignment to the undersigned. |
| Tr. 3 | Page 3 of the hearing transcript. |
| Exh. C-1 | Complainant's Exhibit 1 in evidence. |
| Exh. R-1 | Respondent's Exhibit 1 in evidence. |

6/ 29 U.S.C. 659(a).

After the filing of a Notice of Contest for all alleged violations the parties exchanged a series of motions and appropriate rulings were made.[7/] The case was heard in Pittsburgh, Pennsylvania. The United Steelworkers of America claimed party status as employee representatives but did not appear at the hearing.

Prior to Complainant's case in chief, argument was heard on Respondent's Motion for Sanctions, filed July 21, 1978. Upon consideration of the evidence, partial sanctions were imposed with the result that Items 2 and 3 of the Serious Citation and Items 2, 3, 5, 6, 8 and 9 of the Nonserious Citation were vacated as well as their associated penalties (Tr. 44–46). This sanction was imposed because

---

7/ On May 8, 1978, Respondent filed a Motion for More Definite Statement and a Request for Production of Documents (R.p. 7). On May 31, 1978, the Motion for More Definite Statement was granted (R.p. J–1). Complainant failed to respond to this Order within the period allotted under Fed. R. Civ. P. 12(e). Complainant also failed to respond to Respondent's Request for Documents in the time provided under Fed. R. Civ. P. 34. Thereupon, on July 5, 1978, Respondent filed a Motion to Strike and a Motion to Compel Documents (R.p. J–5). By Order of July 14, 1978 (R.p. J–9), Complainant's failure to file a timely More Definite Statement was excused, good cause being shown and Respondent's Motion to Strike was thus denied. Respondent's Motion to Compel Documents was granted. At this time, Complainant was put on notice that ". . . future failures to comply with Review Commission orders will not be tolerated." (R.p. J–9 at 2).

of Complainant's failure to comply with Review Commission Orders, especially a July 14, 1978 Order to Compel the Production of Documents (R.p. J-9),[8] as well as Respondent's good faith showing of abatement.

---

8/ On July 19, 1978, Complainant filed its documentary submission (R.p. J-11) in compliance with the July 14, 1978 Order to Compel Documents. This submission complied in part with Respondent's request, however, Complainant did not identify which of the submitted documents corresponded with Respondent's original itemized request nor did Complainant explain why certain of the requested items had not been provided. This former shortcoming inconvenienced the Respondent but did not prejudice it in the preparation of its case. The later shortcoming, however, did cause prejudice. Having failed to properly deny possession of documents that might reasonably be presumed to exist, the Complainant substantially hindered Respondent in the preparation of its case. Because of Complainant's defective discovery responses, Respondent was put to the expense and incovenience of filing motions to compel disclosure. At the hearing, Complainant established that it did not possess many of the documents requested by Respondent (Tr. 28-32). At this time, Complainant also supplied an additional document which should have been supplied with its prior submission (Tr. 38). Such explanations and such submissions, even when provided in good faith, are provided too late when provided on the day of hearing. In this case, Complainant was informed that, because of past failure to fully comply with Review Commission Orders and procedures, future failures would not be tolerated (see Note 7 supra). Consequently, upon Respondent's good faith showing of abatement, partial sanctions were imposed pursuant to Fed. R. Civ. P. 37:

> The administration of the rules lies necessarily within the province of the trial court with power to fashion such orders as may be deemed proper to vouchsafe full discovery for the just, speedy and inexpensive determination of the lawsuit. (Robison v. Transamerica Insurance Company, 368 F.2d 37, 39 (10th Cir. 1966)).

The March 7, 1978 inspection, conducted by Compliance Officer (CO) Frank E. Librich resulted in the following Repeat Citation.

Item 1 - Repeated Citation

> 29 C.F.R. 1910.176(b): Material stored in tiers was not stacked, blocked, interlocked or limited in height so that it was stable and secure against sliding and collapse:
>
> (a) Steel Yard: Wooden blocks cracked and broken causing steel stock to collapse.

The prior violation upon which this Repeated Citation is based was issued on February 2, 1975.

After granting of Respondent's Motion for Sanction and after dismissal of Item 1 of the Serious Citation at the conclusion of Complainant's case in chief,[9] the following Nonserious Items arising from the March 7, 1978 inspection remained at issue.

Item 1 - Nonserious Citation

> 29 C.F.R. 1910.22(b)(1): Aisle(s) or passageway(s) were not kept clear and in good repair where mechanical handling equipment was used:
>
> (a) Forge Shop: Loose floor grating in front of Number 40 Upsetter.
> (b) Die Storage: Floor cracked and uneven.

---

[9] This dismissal was based on Complainant's failure to sustain its burden of proof that the hazard associated with the alleged violation was "recognized" within the meaning of the Act. (Tr. 226-228). See National Realty & Construction Co., Inc. v. OSHRC 489 F.2d 1257, 1265 (D.C. Cir. 1973).

Item 4 - Nonserious Citation

29 C.F.R. 1910.219(b)(1): Flywheel(s) with parts seven feet or less above floor(s) or platform(s) were not guarded in accordance with the requirements specified in 29 CFR 1910.219(b)(1)(i) through (b)(1)(vi):

(a) Cold Process Department - Flywheels on mechanical power presses 1491 and 2601.

Item 7 - Nonserious Citation

29 C.F.R. 1910.219(f)(1): Gear(s) were not guarded by a complete enclosure or by one of the methods specified in 29 CFR 1910.219(f)(1)(ii) and (f)(1)(iii):

(a) Steel Yard - exposed gears on the 3313 Shear.

The April 5, 1978 inspection of Respondent's plant resulted in the following Nonserious Citation:

Item 1 - Nonserious Citation

29 C.F.R. 1910.22(a)(1): Place(s) of employment were not kept clean and orderly, or in a sanitary condition:

(a) Forge Shop, in back of Number 7 Trim Press, steel floor plates bent up on corners creating a tripping hazard to the drag-out operator.

The Repeated violation was ordered abated by March 23, 1978. The Nonserious violations from the first inspection were to be abated by April 18, 1978. The consolidated Nonserious violation from the later inspection was to be abated by April 21, 1978.

The cited Occupational Safety and Health Standards provide as follows:

29 C.F.R. 1910.176(b): Item 1 - Repeated Citation

Secure storage.

Storage of material shall not create a hazard. Bags, containers, bundles, etc., stored in tiers shall be stacked, blocked, interlocked and limited in height so that they are stable and secure against sliding or collapse.

29 C.F.R. 1910.22(b)(1): Item 1 - Nonserious Citation

Aisles and passageways.

Where mechanical handling equipment is used, sufficient safe clearances shall be allowed for aisles, at loading docks, through doorways and wherever turns or passage must be made. Aisles and passageways shall be kept clear and in good repairs, with no obstruction across or in aisles that could create a hazard.

29 C.F.R. 1910.219(b)(1): Item 4 - Nonserious Citation

Prime-mover guards.

Flywheels. Flywheels located so that any part is seven (7) feet or less above floor or platform shall be guarded in accordance with the requirements of this subparagraph:

(i) With an enclosure of sheet, perforated, or expanded metal, or woven wire;

(ii) With guard rails placed not less than fifteen (15) inches nor more than twenty (20) inches from rim. When flywheel extends into pit or is within 12 inches of floor, a standard toeboard shall also be provided;

(iii) When the upper rim of flywheel protrudes through a working floor, it shall be entirely enclosed or surrounded by a guardrail and toeboard.

(iv) For flywheels with smooth rims five (5) feet or less in diameter, where the preceding methods cannot be applied, the following may be used: A disk attached to the flywheel in such manner as to cover the spokes of the wheel on the exposed side and present a smooth surface and edge, at the same time providing means for periodic inspection. An open space, not exceeding four (4) inches in width, may be left between the outside edge of the disk and the rim of the wheel if desired, to facilitate turning the wheel over. Where a disk is used, the keys or other dangerous projections not covered by disk shall be cut off or covered. This subdivision does not apply to flywheels with solid web centers.

(v) Adjustable guard to be used for starting engine or for running adjustment may be provided at the flywheel of gas or oil engines. A slot opening for jack bar will be permitted.

(vi) Wherever flywheels are above working areas, guards shall be installed having sufficient strength to hold the weight of the flywheel in the event of a shaft or wheel mounting failure.

29 C.F.R. 1910.219(f)(1): Item 7 - Nonserious Citation

Gears, sprockets, and chains.

Gears. Gears shall be guarded in accordance with one of the following methods:

(i) By a complete enclosure; or

(ii) By a standard guard as described in paragrph (o) of this section, at least seven (7) feet high extending six (6) inches above the mesh point of the gears; or

(iii) By a band guard covering the face of gear and having flanges extended inward beyond the root of the teeth on the exposed side or sides. Where any portion of the train of gears guarded by a band guard is less than six (6) feet from the floor a disk guard or a complete enclosure to the height of six (6) feet shall be required.

The standard cited in the consolidated Citation is:

29 C.F.R. 1910.22(a)(1): Item 1 - Nonserious Citation

Housekeeping.

All places of employment, passageways, storerooms, and service rooms shall be kept clean and orderly and in a sanitary condition.

ISSUES

1. Was Respondent in violation of Section 5(a)(2) of the Act[10/] on March 7, 1978 and April 5, 1978, for its failure to comply with the cited Standards?

2. If in violation, what, if any, penalty is appropriate?

10/ 29 U.S.C. 654(a)(2) provides that;
Each employer -
(2) shall comply with occupational safety and health standards promulgated under this Act.

With respect to Item 1(b) and Item 7 of the Nonserious Citation, Issue 1 is answered affirmatively and an appropriate penalty under Section 17(j) of the Act[11/] is assessed. With respect to Item 1 of the consolidated Nonserious Citation, Issue 1 is answered affirmatively. No penalty is assessed.

With respect to the Repeated Citation and Items 1(a) and 4 of the Nonserious Citation, Issue 1 is answered negatively and thus no penalty is appropriate.

STIPULATIONS

Respondent's full and accurate legal name is Pittsburgh Forgings Company, Incorporated. It is incorporated in the State of Delaware, with its principal place of business in "Pennsylvania". At the time of the inspection, Respondent conceded that it was engaged in business affecting commerce. There were no injuries at the time of the alleged violation. Respondent owned or controlled all equipment and machinery referred to in the Citations. Respondent is a medium size corporation that has a 1.5 percent share of a total market of $1.8 billion. The average daily number of employees is 650. With regard to prior history of violations, Respondent was issued two previous citations in 1975.

---

11/ Section 17(j) of the Act provides:

> The Commission shall have authority to assess all civil penalties provided in this section, giving due consideration to the appropriateness of the penalty with respect to the size of the business of the employer being charged, the gravity of the violation, the good faith of the employer, and the history of previous violations.

## EVIDENCE

### Item 1 - Repeat Violation

The Respondent's steelyard was the location of this alleged violation which involved inadequate blocking within stacks of banded and unbanded steel rods. The prior Citation on which the Repeated Citation was based was issued on February 24, 1975, and stated as follows:

> 29 C.F.R. 1910.176(b) Material, in the following area(s), was not stacked, blocked, interlocked, or limited in height so that it was stable and secure against sliding or collapse: (a) Material stacked in the outside steel yard (some top lifts and south end of center row)

This prior Nonserious Citation was not contested and became a final Order of the Commission pursuant to Section 10(a) of the Act.[12/] At the close of Complainant's case in chief, Respondent moved to dismiss the Repeated Citation (Tr. 228). Thereafter, upon argument from the parties, it was ordered that the Repeated Citation be modified to a Serious Citation (Tr. 237).

Since the conclusion of the hearing, the Commission has clarified the definition of a Repeated violation under the Act. Potlatch Corporation, ___ OSAHRC ___, Docket No. 16183, (January 22, 1979); Belger Cartage Service, ___ OSAHRC ___, Docket No. 76-1480, (March 12, 1979). The Commission stated in Belger at p. 10 that:

> . . . in order to establish a prima facie showing that a violation is repeated under section 17(a) of the Act, the Secretary must show by a preponderance of the evidence that

12/ 29 U.S.C. 659(a).

> the cited employer had been issued a prior citation for failing to comply with the same standard. He must also prove that at least one such previous citation has become a final order of the Commission before the date of the occurrence of the alleged repeat violation. As rebuttal, the cited employer can prove that the factual circumstances of the immediate violation are so disparate from those of the previous violation that no reasonable relationship exists between them. We also stated in Potlatch Corp. that we will not follow the repeated test employed by the United States Court of Appeals for the Third Circuit in Bethlehem Steel Corp., supra, . . . [Footnote omitted; emphasis supplied]

Potlatch stressed the requirement that any repeated violation must be "substantially similar" to the previous violation which had become a final Order of the Commission.

In light of this clarification by the Commission, it is hereby determined that the violation at issue, modified at the hearing from a Repeat to Serious, must now be reinstated to a Repeat. It is clear that the same standard was cited and that the Citation became a final Order of the Commission. Both Citations involved the improper stacking of material in Respondent's steelyard, both Citations were directed to the same hazard, i.e., the danger of a stack collapsing. The Citations are therefore determined to be "substantially similar" (Potlatch). It is also determined that, in view of the ultimate resolution of this issue, the Respondent has not been prejudiced by the foregoing determination.[13/]

---

13/ At the hearing, the parties were not enlightened by the Belger and Potlatch decisions. Consequently, most of the argument focused on whether a Repeated violation existed under Bethlehem Steel. A small amount of argument was introduced relating to the "disparity" of the two Citations (Tr. 228-229), which under Belger is now considered a crucial component of Respondent's rebuttal.

Having determined that the Secretary's denomination of the alleged violation was proper, it must now be determined whether a violation existed. In relation to the Citation on which the Repeated violation is premised, Respondent has argued under Section 9(a)[14] that since the Citation did not describe the violation with particularity, it was "utterly useless in functioning as a statutorily mandated notice-giving device." (R.p. J-18 at 6). Citing Marshall v. B. W. Harrison Lumber Co., 569 F.2d 1303 (5th Cir. 1978) and Secretary of Labor v. Union Camp Corp., 5 OSAHRC 514 (1973), Respondent contended that the Citation's failure to specify which of the more than 200 stacks of steel violated the standard deprived it of the opportunity to determine for itself the facts of the alleged hazard. Consequently, it was argued that Citation No. 2 and the proposed penalty should be vacated.

The notice requirements of Section 9(a) of the Act are not to be strictly read but rather read reasonably as requiring fair, rather than perfect, notice. National Realty and Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973). The notice given by the Citation at issue is adequate and exceeds that quantum judged to be deficient in Harrison and Union Camp Corp. Having been presented with Citation No. 2, and its representatives having accompanied the CO on his inspection of the yard, Respondent could reasonably be expected to

[14] Section 9(a) provides, in pertinent part, that;

> [e]ach citation shall be in writing and shall describe with particularity the nature of the violation. . . (29 U.S.C. 658(a))

have known or readily ascertained by asking the CO during the inspection what stacks, in the CO's opinion, presented a hazard of collapse. It is therefore determined that Citation No. 2 is not fatally lacking in particularity.

The next question to determine is, did the Respondent violate 29 C.F.R. 1910.176(b) on March 7, 1978? Anning-Johnson Co., ___OSAHRC___, Docket Nos. 3694 and 4409 (1976) has held that in order to prove a violation of 5(a)(2) of the Act, the Secretary must establish that a particular standard applies to the facts, that the cited employer failed to comply with the standard and that the cited employer's employees had access to the hazard. The applicability of the standard to the facts herein is not contested. Complainant has also established that Respondent's employee, a "hookup man" was exposed to the hazard of collapsing stacks while passing between stacks during the stacking process (Tr. 92). The remaining issue is whether Complainant proved by a preponderance of the evidence that Respondent failed to comply with the standard?

CO Frank Librich testified that during his inspection of the steelyard, he pointed out a number of cracked and broken blocks within certain stacks which were leaning (Tr. 90). Because of this condition, the stacks were "up at one end," and thus unstable. On cross-examination the CO conceded that the stacks were not in imminent danger of collapse and that a cracked block within a stack would not automatically result in the stack's collapse (Tr. 179). Edward Poola, Respondent's employee and a Grievance Committeeman as

well as a member of the Respondent's Safety Committee, testified that he observed cracked and broken blocks in the yard during the March 7, 1978 inspection (Tr. 205) and that the stacks were consequently resting on an angle (Tr. 207). Mr. Poola also described an injury which allegedly resulted from the collapse of one of these stacks (Tr. 208). However, on cross-examination, he stated that the existence of cracked blocks did not "automatically" cause a stack to collapse and that, although he normally reported any incident of unstable stacking to Respondent's supervisory personnel, he made no report on the day of the inspection (Tr. 210-211). According to Mr. Poola, all complaints were acted upon expeditiously (Tr. 214).

Willaim Pesce, head of Respondent's Safety Committee, and Michael Volpe, Safety Coordinator, both testified that during the course of the inspection the CO did not point out any hazard in the steelyard and that he did not point out any leaning stacks or any broken blocks. Both witnesses testified that the CO did point out a few cracked blocks (Tr. 241 [Pesce], 268, 277-278 [Volpe]). Mr. Volpe testified that, during the course of his employment with Respondent (approximately seven months), there had been no problems with blocking or with leaning stacks of steel (Tr. 278).

Kenneth Craig, foreman of Respondent's steelyard for five and one half years, testified that although he was normally informed of the existence of unstable stacks in the steelyard, he was not informed of any hazardous conditions on March 7, 1978 (Tr. 286-287). Mr. Craig testified that on the day of the inspection none of the

stacks were leaning or in danger of collapse (Tr. 287) and that, during his supervisory tenure, none of the stacks had ever collapsed (Tr. 294). According to Mr. Craig, Respondent had experienced problems with broken blocks within the stacks but that this problem had occured two years prior to this inspection (Tr. 289). Mr. Craig also testified that there had been accidents in the vicinity of the steelyard but that none of these accidents were caused by collapsing stacks (Tr. 292).

Having reviewed the evidence in its entirety, only one fact is observed to stand beyond dispute, i.e., that on March 7, 1978, certain blocks within Respondent's stacked steel were cracked. The evidence otherwise conflicts as to whether a hazard existed in the steelyard, whether the stacks were leaning or collapsed, whether the blocks within the stacks were broken, and whether any injury resulted from a collapsing stack. Foreman Craig's testimony that none of the stacks were leaning or had <u>ever</u> fallen conflicts directly with the CO's and Mr. Poola's testimony that certain stacks were leaning on the day of the inspection.

With respect to the existing cracked blocks, both of Complainant's witnesses conceded that such a deficiency would not automatically result in the collapse of a stack. The casual connection between this single, admittedly existing condition, and the alleged hazard is thus considered tenuous:

> Where all the facts and circumstances in evidence are conducive to speculation and conjecture and do not admit of a rational inference of the truth of the fact in issue there has been a failure by the proponent to meet his burden by substantial, reliable and probative evidence. Secretary of Labor v. Manuel Maes Construction Co., Inc., No. 73-1464 (10th Cir., March 28, 1974).

The evidence is almost wholly in conflict with respect to conditions existing at the time of the alleged violation. Having reviewed notes compiled at this hearing, no reason can be found to discredit the testimony of either party. Focusing on the single established fact, i.e., that cracked blocks existed, it still cannot be determined without resort to speculation and conjecture that a violation was proven and that a hazard (i.e., the danger of falling stacks) existed. Complainant having failed to sustain its burden of proof by a preponderance of the evidence, it is determined the citation must be vacated.

Item 1 - Nonserious Citation

Respondent was charged with failing to maintain aisles and passageways free from obstructions and in good repair in both the Forge Shop and the Die Storage area. In the Forge Shop, the CO determined that a loose floor grating presented a hazard to mechanical handling equipment in the aisleway in front of the No. 40 Upsetter. In the Die Storage area, a 20 to 30 foot long crack in the center of the concrete floor presented a similar hazard to such equipment.

A threshold determination in establishing a violation under 29 C.F.R. 1910.22(b)(1) is whether mechanical handling equipment is used in the area in which the violation is alleged. With respect to 1(a), CO Librich equivocated when asked if mechanical handling equipment was used in the vicinity of the No. 40 Upsetter (Tr. 179-180). The Complainant introduced no additional evidence on this Item. On the other hand, Respondent affirmatively asserted that mechanical handling equipment was not used in the No. 40 Upsetter environs (Tr. 247). In light of Respondent's statement to the contrary, the CO's inability to conclusively assert that mechanical handling equipment was used in this area is fatal to the Complainant's shouldering of its burden on Item 1(a).

With respect to Item 1(b) the CO testified that during the inspection, an employee informed him that while guiding a mechanical hand truck, he had sprained an ankle after the hand truck upset while passing over the crack (Tr. 185). Witness for the Respondent conceded that the floor was cracked and that mechanical handling equipment - mostly hand trucks, ocassionally, a fork truck - were used in the area (Tr. 252). Respondent argued that the crack could not be permanently repaired because of the prevailing weather conditions and the instability of the ground beneath the floor. However, Daniel Viscount, Plant Engineer and Maintenance Superintendent, testified that the crack could be patched on a semi-annual basis, eliminating the hazard, for a cost of $250 (Tr. 302-305).

In view of the fact that mechanical handling equipment was used in the vicinity of the crack; that Respondent knew of the cracks existence; and, that Respondent could repair the hazardous condition, it is determined that the violation set forth in Item 1(b) was established.

Item 4 - Nonserious Citation

The violations underlying Item 4 involved inadequate guarding on the flywheels on power presses 1491 and 2601 in Respondent's Cold Process Department. The CO testified that the existing guard did not extend up to the 7-foot level and that it would not adequately contain any parts which might break off the flywheel (Tr. 100-105). The CO's recollection of the conditions underlying this alleged violation was hazy, e.g., when asked on cross-examination whether the press was in fact equipped with a flywheel - an essential element to the establishment of a violation under the cited standard, 29 C.F.R. 1910.219(b)(1) - the CO could not respond with any degree of certainty (Tr. 202).

Respondent's witnesses, Mr. Volpe and Mr. Viscount, testified that, according to their measurements, the flywheels were guarded up to the 7-foot statutory minimum height (Tr. 273 [Volpe], 301 [Viscount]). Respondent also introduced Exhibit R-6, a photograph of the 1491 press, which persuasively supports Respondent's contention that the existing guard enclosed the flywheel below the 7-foot level. Mr. Volpe testified that the guard photographed in this Exhibit, had not been altered after the inspection (Tr. 279).

With respect to the CO's allegation that the existing guard was not enclosed so that it would contain fragments which might break off the flywheel, it must be borne in mind that the cited standard requires only that a flywheel be enclosed up to the 7-foot level. The standard is silent on precautions which are to be taken to contain flywheel fragments. As stated previously, the Respondent has clearly established that the guard conformed to the requirements of the standard in that it enclosed the flywheel up to the required level. In the absence of more specific guidance from the standard, it can not be concluded that the guards existing on the 1491 and 2601 presses did not conform to the cited standard because they would not adequately contain flywheel breakage.[15/]

In sum, the testimony of Respondent's witnesses and supportive evidence introduced conflicts directly with the testimony of the CO. In view of the CO's inability to confirm that a flywheel even existed on this punch press, his testimony on this Item must be accorded little weight. Respondent's Exhibit R-6 was found particularly convincing. Consequently, it is determined that the Complainant has failed to establish this alleged violation. Item 4 of the Nonserious Citation must be vacated.

Item 7 -- Nonserious Citation

Item 7 of this Citation involved Respondent's failure to adequately guard a gear on the 3313 shear in the steelyard. Both

15/ On this issue, Mr. Viscount, Respondent's Plant Engineer and Maintenance Superintendant, testified that the existing guard would adequately contain breakage and that he, in fact, had observed broken flywheel teeth laying in the guard (Tr. 310).

parties agreed that the distance from the top of the gear to the ground was less than 7 feet (approximately 6 feet) (Tr. 178, 274). Respondent states in its post-trial brief (R.p. J-18) at page 25 that:

> The parties also agree that the gear wheel on the shear was equipped with a band guard (Tr. 107, 275).

If this were true, under 29 C.F.R. 1910.219(f)(1)(iii) the gear would only have to be guarded up to 6 feet, instead of the normally required height of 7 feet, and Respondent would be in compliance with the standard.

Respondent's contention that the parties agreed that a band guard existed on the 3313 shear is inaccurate. A review of the entire record, with special attention to pages cited by Respondent, indicates that agreement does not exist on this point but rather that the existing guard was a "face guard" (Tr. 275). Respondent's contention that a band guard conforming to the standard existed on March 7, 1978, is belied by the fact that, after the inspection, the existing guard was extended to a height of 7 feet and perforated screening was added to the bottom of the guard (Tr. 275).

Having failed to establish that the existing guard was a band guard and having failed to dispute the CO's contention that this guard was less than 7 feet high and that a hazard thus existed, Respondent's arguments that compliance was achieved is not persuasive and Item 7 of the Nonserious Citation is affirmed.

Item 1 - Nonserious Citation (No. 78-2041, Consolidated)

The parties stipulated that a floor plate in front of the No. 7 trim press in the Forge Shop was bent or dog-eared and that, as a result of this condition, a tripping hazard existed (Tr. 58-59). Respondent pointed out that after the inspection this condition was remedied. Respondent contends however that the citation should be vacated as a matter of law since 29 C.F.R. 1910.22(a)(1) does not apply to a dog-eared plate. Specifically, Respondent argued in its brief at page 28:

> The condition at issue does not in any fashion whatsoever involve the clutter and debris customarily associated with lack of order, nor does it involve the dirt or infestation commonly connected with unclean or unsanitary conditions.

The thrust of Respondent's argument would seem to be that the cited standard was promulgated by the Secretary of Labor in the interest of preserving cleanliness and order for cleanliness' and order's sake. Doubtless, the Secretary concurs with the idiomatic placement of cleanliness next to the diety; however, the ultimate concern of the standard is with hazards which normally underlie disorder and filth. One can trip over a dog-eared plate just as easily as a pile of debris. The hazards are identical:

> A housekeeping standard must be worded with some degree of flexibility and generality. No standard, especially housekeeping, can anticipate all of the possible ways in which violative or hazardous conditions could develop. [Footnote omitted] Secretary of Labor v. Plessey-Burton, Inc., 12 OSAHRC 577, 580 (1974) [hereinafter cited as Plessey-Burton].

As pointed out in Plessey-Burton, surpa at 581, "[t]he words clean and orderly have a common and customary meaning . . ." The plain meanings of these words must be reasonably applied to the existing condition to determine whether a violation exists. The first definition of "orderly" encountered in the unabridged edition of the Random House Dictionary of the English Language (1973) is:

> 1. arranged or disposed in a neat tidy manner or in a regular sequence; an orderly desk.

A reasonable application of this definition to the facts of the present case compels the conclusion that the "irregular" surface caused by a dog-eared plate is "disorderly."

In light of the flexible interpretation which is to be accorded the housekeeping standard under Plessey-Burton and in the absence of a more applicable standard, it is hereby determined that 29 C.F.R. 1910.22(a)(1) is applicable to the dog-eared plate in the Forge Shop and that Item 1 of the Nonserious Citation must be affirmed.

PENALTY

The proposed penalty for Item 1 of the Nonserious Citation was $70. As evaluated by the CO, both violations, Items 1(a) and 1(b), were of relatively low gravity. In determining this penalty, the CO also considered Respondent's good faith efforts to provide a safety program as well as Respondent's past history of violations (Tr. 119). Since Item 1(a) has been vacated, a penalty of $35 for Item 1(b) is appropriate.

Item 4 of the Nonserious Citation and Item 1 of the consolidated Nonserious Citation are also affirmed herein. The CO determined that no penalty was appropriate for these violations. In view of the Respondent's rapid abatement of the conditions underlying these violations and the statutorily mandated factors set out in Section 17(j) of the Act,[16] the CO's evaluation is credited and no penalty is assessed.

CONCLUSION

The jurisdiction of the Review Commission in this case is not contested and is established by the pleadings and stipulated facts, pursuant to Sections 3(4), (5) and 10(c) of the Act.[17]

Based upon the foregoing which constitute the findings of fact and conclusions of law herein, and pursuant to Sections 10(c) and 12(j) of the Act,[18] it is hereby,

ORDERED:

1. (a) That Item 1(b) of the Citation for Nonserious Violation of 29 U.S.C. 654(a)(2) for failure to comply with the Occupational Safety and Health Standard set forth at 29 C.F.R. 1910.22(b)(1) is AFFIRMED; (b) A $35 penalty is assessed.

2. (a) That Item 7 of the Citation for Nonserious Violation of 29 U.S.C. 654(a)(2) for failure to comply with the Occupational Safety and Health Standard set forth at 29 C.F.R. 1910.219(f)(1) is AFFIRMED; (b) No penalty is assessed.

16/ See Note 11, supra.

17/ 29 U.S.C. 652(4), 652(5), and 29 U.S.C. 659(c).

18/ 29 U.S.C. 659(c) and 29 U.S.C. 661(i).

3. (a) That Item 1 of the consolidated Citation, OSHRC Docket No. 78-2041, for Nonserious Violation of 29 U.S.C. 654(a)(2) for failure to comply with the Occupational Safety and Health Standard set forth at 29 C.F.R. 1910.22(a)(1) is AFFIRMED; (b) No penalty is assessed.

4. That the single-Itemed Citation for Repeat Violation of 29 U.S.C. 654(a)(2) for failure to comply with the Occupational Safety and Health Standard set forth at 29 C.F.R. 1910.176(b) is VACATED.

5. That Item 1(a) of the Citation for Nonserious Violation of 29 U.S.C. 654(a)(2) for failure to comply with the Occupational Safety and Health Standard set forth at 29 C.F.R. 1910.22(b)(1) is VACATED.

6. That Item 4 of the Citation for Nonserious Violation of 29 U.S.C. 654(a)(2) for failure to comply with the Occupational Safety and Health Standard set forth at 29 C.F.R. 1910.219(b)(1) is VACATED.

NOTICE OF DECISION

Secretary v. Jackson Marine Companies
OSHRC Docket No. 81-635

Enclosed is a copy of my decision in the above-entitled case. This decision constitutes my final disposition of the proceeding pursuant to 29 U.S.C. §661(i) and 5 U.S.C. §557. I have this date mailed the original decision together with the Commission's file, transcript of testimony, and all exhibits to Richard Shiffmann, Chief Review Counsel, at the Commission's Office in Washington, D.C.

I am required to advise you as follows:

(1) The decision will be filed with the Commission on February 22, 1982 and will become the final order of the Commission on March 24, 1982 unless a member of the Commission directs that it be reviewed. Parties will not receive any further communications from the Commission unless the decision is directed for review. (See paragraphs 4, 5, and 6 below.)

(2) You may petition for discretionary review of this decision by the Commission. An original and three copies of such a petition must be submitted in accordance with 29 CFR 2200.91. The last day the Commission may consider your petition is March 24, 1982, the final order date. This final order date is set by law and cannot be extended.

(3) Petitions for review should be mailed to:

Richard Shiffmann, Chief Review Counsel
Occupational Safety & Health Review Commission
1825 K Street, N.W.
Washington, D.C. 20006

(4) Should review be ordered, each party will be notified and given opportunity to submit a brief.

(5) Please complete and mail the enclosed postcard, indicating whether you presently intend to seek review of this decision. Your response on the card does not bind you in any way, but assists the Commission in scheduling future workload.

(6) For further details on the review process, see Commission Rules 90, 91, 92, 93, 94, and 95.

900 S.W. Fifth Avenue
Portland, Oregon 97204

Attorney for Respondent

## DECISION

The Portland, Oregon worksite of Jackson Marine Companies was inspected by the Secretary's Safety and Health Specialist on January 29, 1981. Thereafter, two citations and notices of proposed penalty were issued by the Secretary charging Jackson Marine Companies with four safety violations of the Act.[1/] Jackson has denied the charges but has admitted jurisdiction.[2/]

## THE INSPECTION

The principle issue in this case concerns the validity of the warrantless inspection. Jackson alleges that its foreman, Dan Wamsley, refused the inspector entry aboard the barge, SIOUXON. However, after the inspector assured Mr. Wamsley that he would not conduct an inspection, he was allowed to board the vessel.[3/] Jackson argues that once the employer's representative has refused the inspector the right to enter the workplace, the inspector must obtain a search warrant prior to entry or else the inspection is invald. MARSHAL v. BARLOW'S INC., 436 U.S. 307, 98 S.Ct. 1816 (1978). The inspector testified that he had identified himself and presented his credentials to the foreman. He stated that he informed the foreman of the nature, purpose and scope of the inspection and held an opening conference with him prior to gaining access to the work barge. After the conference, the foreman directed the crane operator to transport the inspector to the barge. The inspector entered a cage that was on the pier. The crane then lifted the cage to the barge.[4/]

The issue is reduced to the conflict in testimony between that of the inspector and the foreman. After observing both witness while testifying and considering their demeanor, I conclude that the inspector's testimony was far more credible than that of the foreman. Indeed, I give little weight to the foreman's testimony. The foreman had had his position for only six months prior to the inspection. He admitted that there was a company policy that requires him to refuse entry to any non-employee until after he contacts his supervisors and obtains their permission to allow the person to enter the worksite. The foreman didn't do this. He is a working foreman and was busy at the time of the inspection. There had been some commotion in the area due to a smokey tire fire near the pillars of a loading pier. After listening to the foreman's testimony and viewing his demeanor I conclude that the foreman's testimony regarding the event was not credible. He appeared to be attempting to safeguard his job by blaming the inspector for the violation of Jackson's procedures. Consequently, I conclude that the compliance officer was not denied entry; did not use subterfuge to obtain entry; that the foreman waived the employer's rights to a search warrant and, therefore, the inspection was valid.

## BUOYANT VEST

The serious violation alleged in Citation 1, Item 1 charges that one employee was welding a beam within twelve feet of an

unguarded deck of the barge without the protection of a buoyant vest.[5/]

Findings of Fact

The work barge was afloat and anchored in the waterway, the Willamette River. The vessel was 100 feet long and 50 feet wide. One employee was welding two beams within twelve feet of the unguarded edge of the barge. He was wearing a welding helmet. He did not have a U.S. Coast Guard approved work vest or buoyant vest. He had no safeguard to keep him from falling off the edge of the barge or to keep him afloat in the water. The water was approximately 35 feet deep at that point. The deck was strewn with pieces of steel, welding leads, wooden blocks, and other items on which he could trip. Had he fallen into the water without the floatation devices there was a substantial probability that he would have drown.

Opinion

The inspection was fair and impartial. In regard to this alleged violation, the employer has not denied violative conditions but instead claims that this was an isolated incident of employee misconduct.

The evidence establishes the violation as alleged. The violative conditions were serious. With the exercise of reasonable diligence, the foreman could have known of the conditions. Therefore, the item will be affirmed as alleged.

As to the argument in defense, nothing was shown indicating that the employee's conduct in any way limited the employer's ability to recognize the violative condition or abate it. Therefore, the employer will be held responsible.

## PORTABLE FIRE EXTINGUISHERS

Item 1 of Citation 2 charges the employer with failing to periodically inspect a multi-purpose dry chemical fire extinguisher.[6/]

### Findings of Fact

The fire extinguisher concerned was located near the engine area of the crane and adjacent to a permanently affixed stairway on the barge. The gauge on the extinguisher indicated that it was inoperable and needed recharging. It had last been inspected in July of 1979.

The fire extinguisher was located in a work area. Hot work was being done nearby. There were occasional fires such as the tire fire. Therefore, employees had access to the zone of danger. With the exercise of reasonable diligence, the employer could have become aware of the existence of the hazard. The hazard was the possibility of burns resulting from a fire that could have been stopped by a fully charged fire extinguisher.

### Opinion

The facts alleged establish the violation as charged. The employer does not deny the violative condition but claims that the Commission has previously ruled that portable fire extinguishers

are exempt from annual inspections. They cite GEORGE J. IGEL & CO., INC. 78 OSAHRC 44-C2, 6 BNA OSHC 1642, 1978 CCH OSHD 22,769 (No. 76-1087, 1978).

In the present case as in IGEL, stored-pressure extinguishers with pressure gauges are concerned. In each case, the gauge indicated that the extinguisher was in other than fully operable condition. In each case, the employer was charged with failing to periodically inspect inoperable fire extinguishers. Obviously in this case, the gauge which was in plain sight had not been inspected; otherwise it would have been recharged. Therefore, the employer violated the standard as alleged.

## LIFESAVING SKIFF

Citation 2, Item 2 charges that the employer did not have a lifesaving skiff immediately availble.[7/]

### Findings of Fact

A steel boat approximately twenty feet long was stowed and secured to the barge. It was not in the water. It did not have oars or other means of propelling it. The motor was detached from the boat after it had broken down. There was no other lifeboat aboard the barge or in the water next to the barge.

### Opinion

The credible evidence presented establishes the violation as alleged. The Respondent does not deny that the twenty foot

long boat was not available to rescue an employee in the water. Instead, it claims that there was another skiff available. Again, there is a conflict in testimony, the resolution of which decides the issue. As the inspector's testimony is found to be more credible than that of the foreman, the item will be affirmed as alleged.

## RING BUOYS

Citation 2, Item 3 concerns the absence of a ring buoy with a line at least ninety feet long.[8/]

### Findings of Fact

A life ring on the barge had a line attached that was only thirty feet long. There were not other life rings available on the barge. Had someone fallen in the water, due to the short length of line, there was a possibility that the ring would not reach the employee.

### Opinion

The credible evidence establishes the violation as alleged. Again, there is a conflict of testimony. The foreman stated that there was another ring with ninety feet of line that was inside the crane shack. The conflict is again resolved in the Complainant's favor, and therefore the item will be affirmed as alleged.

## PENALTY

The evidence presented regarding the employer's gross annual income and the number of its employees establishes that it has a small business. After considering this, the gravity of the violations, the lack of previous history and the good faith of the employer, it is concluded that the penalty proposed is appropriate.

## ORDER

The citations herein and the notices of proposed penalty are AFFIRMED. A total penalty of $180 is ASSESSED.

Erwin L. Stuller

ERWIN L. STULLER
Judge

DATED: February 22, 1982

## FOOTNOTES

1/ The violations were alleged to have taken place at the time of the inspection on January 29, 1981. The citations were issued on February 13, 1981. They charge that Jackson Marine Companies failed to comply with safety regulations in violation of Section 654(a)(2) of the Occupational Safety and Health Act (29 U.S.C. 651 et seq.). Citation No. 1 charges one Serious violation of the Act. Citation No. 2 charges three nonserious violations of the Act.

2/ Jackson filed a timely notice of contest. At that point the Commission acquired jurisdiction over the subject matter under Section 659 of the Act. Jackson admitted jurisdiction in its answer. It is consequently concluded that Jackson is an employer with employees engaged in a business affecting commerce within the meaning of Section 3 of the Act.

3/ Respondent's Brief page 3, Tr. pp. 87-94.

4/ Tr. pp. 18-21

5/ A description of the violation alleged, the proposed penalty, and the safety standard concerned are as follows:

Citation No. 1, Item 1 (Serious)

> One employee was observed welding a beam within twelve feet of the unguarded deck of the work barge and was not protected with a U.S. Coast Guard approved work vest or buoyant vest.

In violation of 29 CFR 1926.605(d)(3)

Proposed Penalty: $180

29 CFR 1926.605(d)(3) provides:

> Employees walking or working on the unguarded decks of barges shall be protected with U.S. Coast Guard-approved work vests or buoyant vests.

6/ A description of the violation alleged, the proposed penalty, and the safety standard concerned are as follows:

Citation No. 2, Item 1 (Other)

> Portable fire extinguishers were not inspected periodically in accordance with maintenance and use of portable fire extinguishers, N.F.P.A. No. 10A-1970:

In that the multi-purpose dry chemical extinguisher located on the barge SIOUXON had not been examined and tested since July 1979.

In violation of 29 CFR 1926.150(c)(1)(viii).

Proposed Penalty: $0

29 CFR 1926150(d)(1)(viii) provides:

> Portable fire extinguishers shall be inspected periodically and maintained in accordance with Maintenance and Use of Portable Fire Extinguishers, NFPA No. 10-A-1970.

7/ A description of the violation alleged, the propose penalty, and the safety standard concerned are as follows:

Citation No. 2, Item 2 (Other)

> A lifesaving skiff was not immediately available at locations where employees were working over or adjacent to water:
>
> > In that the 20-foot long boat being stowed on the deck of the barge SIOUXON had no motor attached in the event it was needed to rescue employees in water.

In violation of 29 CFR 1926.106(d).

Proposed Penalty: $0

29 CFR 1926.106(d) provides;

> At least one lifesaving skiff shall be immediately available at locations where employees are working over or adjacent to water.

8/ A description of the violation alleged, the proposed penalty, and the safety standard concerned are as follows:

Citation No. 2, Item 3 (Other)

> Ring buoys with at least 90 feet of line were not provided and readily available for emergency rescue operations:

In that life ring on the barge SIOUXON at the aft end of the crane had only 30 feet of line attached to same.

In violation of 29 CFR 1926.106(c).

Proposed Penatly: $0

29 CFR 1926.106(c) provides:

> Ring buoys with at least 90 feet of line shall be provided and readily available for emergency rescue operations. Distance between ring buoys shall not exceed 200 feet.

## DECISION

The Colstrip, Montana worksite of Combustion Engineering had an industrial accident on March 5, 1981. Thereafter the site was inspected by the Secretary's compliance officer on March 9, 1981. A citation and notice of proposed penalty were then issued by the Secretary charging C. E. with a serious violation of the Act. C. E. has denied the charge.[1/]

C. E. has been charged with failing to secure and properly balance a load in a sling or lifting device before it was lifted more than a few inches.[2/] C. E. contends that the load was properly secured and balanced but that after the load was lifted and lashed to the crane, the crane operator overloaded the tie-off line by booming out too far and too quickly causing the tie-off line to part which allowed the load to swing out from the crane.

## Findings of Fact

On March 5, 1981 C. E. was engaged as a subcontractor erecting two units for Montana Power Company at Colstrip, Montana. The units were part of a coal-fired, fossil-powered energy generation plant.

Two of its employees, who are boilermakers, had selected a riser tube about sixty feet in length to be attached to the unit that was some distance away. The employees had rigged the riser with a single wrap and a steel choker. After the crane lifted the riser, the riser was attached to the body of the crane

with a tie-off rope. The load was secured and properly balanced. The mobile crane was to carry the load three hundred yards away where it was to be installed.

After the riser was tied off, the crane boomed up making the tie line taut. The boilermakers started to walk away. They heard a popping sound. Two of the three strands of the tie line had parted. The rigging came loose, shifted and became unbalanced. Part of the riser swung out and struck one of the employees, Mr. Luloff, breaking his leg.

Four days later the compliance officer, Mr. Woodford, inspected the site but did not see the tie-off line. He assumed that it was intact, although Mr. Thomas, the other boilermaker, had informed him that before the riser slipped the crane was booming up and he heard a popping sound.

It was the compliance officer's opinion that the accident resulted because there was only a single wrap of the riser. In his opinion, a double wrap would have reduced slippage.

H. D. Luloff, William Thomas, and Monte Cassidy, the boilermakers' Business Agent, believed that a single wrap was standard practice in the industry. In some cases double wrap is used. Messrs. Luloff and Thomas believe that at the time the crane lifted the riser, it had been well secured and properly balanced.

## Opinion

The complaint charges that the load was not well secured and properly balanced in the lifting device before it was lifted

more than a few inches. The only evidence going to this point was the testimony of the two boilermakers who had lashed the load. They stated that the load was secure and well balanced after it was lifted and tied off. The testimony of these employees was highly credible. As there is no evidence contradicting this, the citation will be vacated.

The Complainant contends that the load would have been better secured had a double wrap been used and had the choker been nylon rather than steel. However, the standard is vague as to the specific techniques of securing this type of load. The two boilermakers and their Union Business Agent, Mr. Cassidy, testified that the single wrap method of securing the load was accepted industry practice. There was no evidence to the contrary. Therefore, the use of an accepted industry practice complies with the safety standard if the standard, such as the one concerned here, is broadly worded and generally vague. CAPE & VINEYARD DIV. v. O.S.H.R.C., 512 F.2nd 1148 (1st Cir. 1975).

The Complainant implies that the accident resulted from the method used to rig the load. But this ignores the evidence that the accident occurred after the rigging had been completed and due to an error of the crane operator in booming out too quickly. The Complainant's contention is based entirely upon the opinion of the compliance officer. The compliance officer's testimony is given little credibility and his opinions are given no credibility. The compliance officer was not at the

site at the time of the incident. He ignored statements made to him by the two boilermakers who were occurrence witnesses. He did not see the broken tie-off rope, but assummed that it hadn't broken. His opinion as to how the accident occurred runs contrary to the opinions of the occurrence witnesses. This is in spite of the fact that the compliance officer had virtually no experience in the specific type of activity being conducted by the boilermakers, whereas the boilermakers had done this paticular task thousands of times over many years. All conflicts between the compliance officer's testimony and the testimony of the two occurrence witnesses are resolved in favor of the two occurrence witnesses. It appears here that the load was well secured and properly balanced in the lifting device and that it was lifted several inches and then tied off. The accident occurred at a slightly later point in time due to an error of the crane operator in booming out. It follows then that the Respondent did not violate the standard as alleged.

## ORDER

The citation and notification of proposed penalty are VACATED.

Erwin L. Stuller

ERWIN L. STULLER
Judge

DATED: February 22, 1982

## FOOTNOTES

1/ The violation was alleged to have taken place on March 5, 1981. The citation was issued on March 20, 1981. It charges that C. E. failed to comply with safety regulations in violation of Section 654(a)(2) of the Occupational Safety and Health Act (29 U.S.C. 651 et seq.). C. E. filed a timely notice of contest. At that point the Commission acquired jurisdiction over the subject matter under Section 659 of the Act. In its answer C. E. admitted jurisdiction.

2/ The complaint amends the citation. A description of the alleged violation, as amended, the proposed penalty, and the safety standard concerned are as follows:

Citation 5, Item 1 (Serious)

> Crawler, truck, or locomotive cranes in use did not meet the applicable requirements for operation as prescribed in the ANSI B 30.5-1968 Safety Code for Crawler, Locomotive and Truck Cranes:
>
> > ANSI B 30.5-1968 Section 5-3.2.3(a)(2): The load was not well secured and properly balanced in the sling or lifting device before it was lifted more than a few inches.

in violation of 29 CFR 1926.550(b)(2)

Penalty Proposed: $700

29 CFR 1926.550(b)(2) provides:

> All crawler, truck, or locomotive cranes in use shall meet the applicable requirements for design, inspection, construction, testing, maintenance and operation as prescribed in the ANSI B 30.5-1968, Safety Code for Crawler, Locomotive and Truck Cranes.

## DECISION AND ORDER

Fier, Judge:

## PRELIMINARY STATEMENT

This is a proceeding pursuant to section 659 of the Occupational Safety and Health Act of 1970 (29 U.S.C. § 651, et seq., hereinafter called the Act), wherein Respondent contests the citation and penalty for one serious violation.

The citation dated May 15, 1981, was based on an inspection conducted during the period April 21, 1981 to April 30, 1981. The citation and proposed penalty was issued pursuant to Section 9(a) and 10(a) of the Act.

In accordance with section 10(c) of the Act, 29 U.S.C. § 659(c), Respondent through a letter dated June 2, 1981, noted its timely contest of the citation.

The citation for the alleged violations set forth the following:

Serious Citation No. 1, Item 1, Standard 29 CFR 1926.28(a):

Appropriate personal protective equipment was not worn by employee(s) in all operations where there was exposure to hazardous conditions:

> Roof Top (pitched work areas) at 164-27 85th Avenue, Howard Beach. Employee observed installing shingles without safety belt and lines or other means of fall protection.

A penalty of $240.00 was proposed.

## ISSUES

1. Whether the Respondent violated the Occupational Safety and Health Act as alleged.

2. Whether the Respondent failed to comply with section 29 CFR 1926.28(a); if so, did the Respondent violate 29 U.S.C. 654(a)(2) of the Act.

3. If the Respondent is found to have violated the above, what penalty or penalties, if any, should be assessed.

## EVIDENCE

### SUMMARY OF TESTIMONY

Henry Piencinski, a Compliance Officer for the United States Department of Labor, for a period of three years, conducted an inspection on April 21, 1981. The construction site consisted of three buildings. They were described as mother-daughter type buildings with a plywood roof. There were three buildings in the same stage of construction at the worksite (Tr. 6, 7).*

April 21, 1981, was described as a rainy day. However, in the afternoon the C.O.** stated that he met with the Respondents. He had a previous opening conference with the General Contractor and was now meeting with the Respondents (Tr. 9).

---

*Denotes transcript page number.
**Denotes Compliance Officer.

There were no employees working on the date of inspection. He only discussed the inspection with H. Tillman, the President, and Leonard Tillman, the Vice-President (Tr. 10).

The Respondents stated that they were not working that day but were only bringing materials to the site. The C.O. said that he would be back on a day that the employees were working. The employees were not unionized. At the time of inspection there were two employees and the Tillmans (Tr. 14).

The C.O. next returned to the site on April 28, 1981, with the General Contractor accompanying them, he saw two employees. One worker was on the sixteen-foot level and the other was on the edge of the roof (Exhibit C-1, C-2). The employees had no protective equipment (Tr. 19). The C.O. asserted that the employees violated section 29 CFR 1926.28(a), which is a serious violation (Tr. 24). There was no safety equipment to protect them from a fall. He took a picture and then tried to get the employees names, but the employees refused (Tr. 19, 20). The General Contractor then responded that they were employees of Respondent, Tillman (Tr. 21). The C.O. then measured the fall distance to be sixteen feet (Tr. 21). They were standing within three feet from the edge (Tr. 22). He later checked the dimensions with the plans and verified the measurements (Tr. 22). There were no lanyards, safety belts, or other protective equipment. A lifeline could have been tied to a chicken ladder on the

other side of the building or even the skylight (Tr. 25, 26). He saw the employees bringing a skylight up the ladder to be assembled in the center of the roof. The observation made, indicated that the condition was hazardous (Tr. 28).

Exhibit C-2, is a picture taken April 28, 1981, at the worksite (Tr. 28). The picture shows two employees, one on the roof and one on the ladder, pushing up the skylight. Mr. Nerrie was on the 16-1/2-foot level about two feet from the edge of the roof (Tr. 30). The eave was 16 feet from the ground.

The C.O. evaluated the extent of the violation and determined that the $600.00 unadjusted proposed penalty should be reduced by 40 percent for size because it is a small business and 20 percent because there were no previous violations. The unadjusted proposed penalty was therefore reduced by 60 percent to an adjusted proposed penalty of $240.00 (Tr. 35).

The C.O. stated that the names of the employees whom he observed in Exhibit C-2 were given to him by Leonard Tillman (Tr. 36). The C.O. said that he had a closing conference on April 30, 1981, at which time he told Mr. Tillman that he observed the employees working on the roof without safety belts and it was at that time that the names of the employees were given to him (Tr. 37).

The C.O. stated that after the photo was taken, he made his measurements. The skylight was to be installed on the roof. The C.O. indicated that safety belts or lifelines could have been used. The inside of the building was not completed. A lifeline could have been attached to the other side of the roof under the eave (Tr. 51). If working on the peak, it would be tied off on both sides to prevent a fall. The C.O. stated that the employees were in an area of danger for one to two minutes.

The Respondent's Exhibit 1, consisting of the citation, refers to the fact that the citation alleges that shingles were being installed without a safety belt (Tr. 66). The Respondent indicates that shingles were not being installed. The Respondent also indicates that the testimony of the C.O. does not form to paragraph 5 of the complaint and refers to a skylight, not as to installation of a roof. Further, the allegations in the complaint and the testimony are said to be inconsistent.

The Respondent called no witnesses.

## OPINION

The Secretary has presented evidence which alleges that the Respondent's employees failed to use personal protective equipment when observed by the C.O. The Respondent offered no evidence other than the citation (Exhibit R-1). The evidence is therefore adopted as to the fact that the

workers were not wearing personal protective equipment when they were exposed to a fall hazard while working on the roof at the worksite.

The issue raised by the Respondent asserts that the citation says the employee was "observed installing shingles" (Exhibit R-1).

The citation states; "Appropriate personal protective equipment was not worn by employee(s) in all operations (emphasis added) where there was exposure to hazardous conditions:" (Exhibit R-1). A plain reading of the above leaves little doubt that personal protective equipment was required in all phases of the roofing operation. A fall hazard of approximately 16 feet is sufficient to establish the seriousness of a fall. Therefore, as noted in Exhibit C-2, it is clear that the lifting of the skylight is part of the roofing operation and hazardous without personal protective equipment. Accordingly, the Respondent's argument that the evidence was not related to the citation must fail.

The Respondent's argument that the Secretary failed to amend the pleadings to conform to the proof also lacks merit.

The evidence presented sufficiently established the violation by the testimony and the photograph. Accordingly, the Secretary has carried its burden of proof.

Finally, the Respondent alleges that the evidence failed to establish the identity of the workers as being those of the Respondent. I disagree, (Tr. 14, Exhibit C-1, question 12 and answer). There is clear and convincing unrebutted evidence that the employees were identified as those of the Respondent (Exhibit C-1). All motions not previously or herewith disposed of are denied.

In considering the proposed penalty, the criteria set forth in the statute have been considered in light of the evidence herein. I find that the proposed adjusted penalty is fair and proper and should be affirmed.

## FINDINGS OF FACT

The credible evidence and the record as a whole establishes preponderant proof of the following facts:

1. Respondent. H. Tillman & Sons, Inc., is engaged in the roofing business. The materials used, and effects on commerce, establishes that it is engaged in interstate commerce.

2. The Respondent's employees were observed exposed to a fall hazard by failing to wear personal protective equipment while engaged in roofing operations, thus failing to meet the requirements of the standard 29 CFR 1926.28(a).

## CONCLUSIONS OF LAW

1. The Respondent is and was at all times herein, in a business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970.

2. The Occupational Safety and Health Review Commission has jurisdiction over the subject matter and parties to this action.

3. Respondent violated 29 U.S.C. 654(a)(2) by failing to comply with 29 CFR 1926.28(a).

## ORDER

Upon the basis of the foregoing findings of fact and conclusions of law, and upon the entire record, it is hereby ORDERED that:

Citation number one, item one, is affirmed.

Attorney for Respondent

DECISION AND ORDER

Edward V. Alfieri, Judge.

These cases, brought under Section 10(c) of the Occupational Safety and Health Act (29 U.S.C. 651, et seq.), involve citations arising from two separate inspections conducted by the Secretary of Labor at the New York Telephone Company's facilities at 88-11 165th Street, Jamaica, New York. An order of consolidation was issued on October 26, 1981.

At the opening of the hearing, Respondent moved to withdraw its notice contesting item 3 of the serious citation issued in case 80-1531. The item alleged Respondent failed to comply with 29 CFR 1910.304(f)(4). The Secretary moved to reduce the proposed penalty for the item to $200.00 from $400.00. The motions were granted.

Also in case 81-1531, the Secretary moved to withdraw items 1(a) and 1(b) and item 2 of nonserious citation 2. The items alleged Respondent failed to comply with 29 CFR 1910.38(a)(1), 29 CFR 1910.38(b)(1) and 29 CFR 1910.156(b)(1). The motion was granted.

During the course of the sixth day of hearing, the parties placed into the record the terms of a settlement agreement (Joint Exh. 1) which amicably resolved all of the issues except one. That is, whether or not Respondent's admitted failure to comply with safety standard 29 CFR 1910.22(a)(1)[1] by maintaining tripping hazards[2] on the ninth and tenth floors is properly

---

1. The standard reads: (a) Housekeeping. (1) All places of employment, passageways, storerooms, and service rooms shall be kept clean and orderly in a sanitary condition.

2. The hazards are described as:

   9th floor was not kept orderly to eliminate tripping hazards of the following conditions and at the following locations. Conditions - inside wiring cables were not secured out of aisle ways, work areas, under desks and at desk locations. . .

   10th floor: Tripping hazards in the following areas. 1, 3 and 5 - Electrical and telephone boxes in aisles, between aisles, at desks. Inside wiring cables hanging from ceiling, creating tripping hazards. Loose boxes not secured in place. Work areas not kept in an orderly condition, because of inside wiring cables running along floor in work areas.

classified as a serious violation within the meaning of Section 17(k) of the Act[3] (29 U.S.C. 666(j)).

Accordingly, the settled portions of the case are hereby severed from the remaining issue and will be disposed of by separate order to be issued simultaneously with this decision.

## THE EVIDENCE

The Secretary offered the testimony of his Compliance Officer Everett Hall and Respondent's employees Karen Johnson and Carolyn Blocker. Johnson and Blocker are also union[4] stewards.

Hall testified that the violative conditions, in his opinion, were serious.

He based that on his observations of conditions on the ninth and tenth floors; oral statements made to him by Respondent's employees that others sustained fall injuries and his examination of Respondent's occupational injury and illness list[5] (Exh. C-1). That document shows two employees sustained

---

3. Section 17(k) provides:

> For purposes of this section a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

4. United Telephone Workers.

5. OSHA Form 200.

ankle and knee sprains when they tripped (Tr. 52).

He foresaw the probability of an employee sustaining a broken toe or foot (Tr. 56), a head or knee injury (Tr. 412) when falling and striking a desk or other equipment (Tr. 413).

Karen Johnson testified that an employee (Linda Cook) tripped and struck her head on a desk and was taken to the hospital (Tr. 433). Stitches were applied to her wound and she lost work time (Tr. 462). She did not witness the accident (Tr. 602). The New York State Workmans Compensation Board decision (Exh. C-26) introduced through Johnson refers to Cook's injuries as "Laceration of Scalp - Contusion of Head. No serious Facial Disfigurement." The time loss was eight weeks.

Carolyn Blocker testified that she recalled an employee[6] tripping but not sustaining any injuries (Tr. 501, 502) and that Miss Cook fell and struck her head (Tr. 506).

Called by the Respondent, Norman Wood testified that he is a member of the corporate safety staff. Among his duties is the inspection of Respondent's workplaces to insure safe conditions and correct those that are not (Tr. 589-594).

In his opinion, an employee tripping and falling in either the ninth or tenth floor areas would probably sustain bruises, cuts or lacerations and not a sprain or pulled muscle. It was more probable that no injury would occur. He could not conceive of a person in either area sustaining serious injury or death (Tr. 594-596).

---

6. Lucy Smolich (Tr. 509).

On cross-examination, he expressed the opinion that it was unlikely that a person would hit his or her head on a desk when tripping (Tr. 598).

## DISCUSSION

Whether a violation is serious under Section 17k of the Act depends on the "substantial probability" that death or serious harm will result from an accident, and not on the probability that an accident will occur. Secretary v. Niagara Mohawk Power Corp., 7 BNA OSHC 1447, 1450, 1979 CCH OSHD ¶ 23,670 at p. 28703 (No. 76-2414).

"Substantial" is a relative not an exact word, the meaning of which is to be gauged by all the circumstances surrounding the admitted violative conditions. It imports a greater probability of a serious injury or death occurring in opposition to that which is small or infrequent.

What is "substantial probability" of a serious injury or death occurring must be determined by facts as developed in each case. Thus, the term "substantial probability" is susceptible to different meanings according to the circumstances.

The Secretary's opinion that Respondent's violation of 29 CFR 1910.22(a)(1) constitutes a serious violation may not be rejected unless such opinion is plainly erroneous or inconsistent with the Act's wording. Considered within the framework of this case the Secretary's contention is flawed.

He construes a past isolated incident, that was not the basis for the citation, as proof of a substantial probability that similar incidents will occur with frequency under the same conditions. That conclusion has no support in the record. The immutable fact is that numerous other tripping incidents have occurred under the same conditions resulting in either no injury or only minor sprains.

Both parties cite Review Commission and Court opinions in support of their argument that a decision for each should be rendered. It would seem idle to distinguish these cases from the instant case, or even to discuss them, for the reason that those cases involve either conditions at construction sites or machinery at industrial plants. They are hardly analogous to conditions in a fully carpeted business office.

## FINDINGS OF FACT

All of the facts stated in the stipulation are adopted as findings of fact.

## CONCLUSIONS OF LAW

1. Respondent is, and at all times material hereto was, engaged in a business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970.

2. Respondent is, and at all times material hereto, was subject to the requirements of the Occupational Safety and Health Act and the standards promulgated thereunder and the Commission has jurisdiction of the parties and of the subject matter herein.

3. Respondent violated section 5(a)(2) of the Act (29 U.S.C. 654(a)(2)) in that it failed to comply with 29 CFR 1910.22(a)(1).

4. The violation for failure to comply with 29 CFR 1910.22(a)(1) is not serious within the meaning of the Act.

5. Respondent violated section 5(a)(2) of the Act (29 U.S.C. 654(a)(2) in that it failed to comply with 29 CFR 1910.304(f)(4).

O R D E R

The citation for failure to comply with 29 CFR 1910.22(a)(1) is affirmed as nonserious.

No penalty is assessed.

Items 1(a), 1(b) and 2 of nonserious citation 2, (in case 81-1531) are vacated.

A penalty of $200.00 is assessed for failure to comply with 29 CFR 1910.304(f)(4).

Those parts of the case that are the subject of the stipulation are severed from this ruling.

JUDGE'S DECISION FEB 25 '82 FINAL ORDER ON MAR 25 '82 RECEIVED

## ORDER OF DISMISSAL

These are companion cases resulting from OSHA inspections of the respondent's "Southworks" plant in Chicago.

The cases were set for trial to commence August 10, 1981. The complainant's attorney appeared at the scheduled time and announced he would offer no evidence in support of the allegations in the complaints. He filed a "Statement of Position" declaring that the Commission lacked jurisdiction to hear the matters because the respondent's notice of contest in each case had been untimely filed.

The respondent thereupon moved to dismiss the proceedings upon grounds that complainant had failed to prosecute, and had failed to meet his burden of proof.

For reasons that follow, the motion for dismissal will be granted.

It has consistently been the position of the complainant that the notices of contest herein were filed too late and that such tardy filing excised respondent's right to a hearing upon the merits. According to complainant, the Commission is without jurisdiction or discretion in the matter and must perform the ministerial act of affirming the alleged violations exactly as charged in the citations, and approving the penalties proposed by the complainant in the total sum of $21,400.

Complainant asserts that respondent's notice of contest was one day late in one case (80-2281) and two days late in the other (80-2282).

The applicable law requires a notice of contest to be filed "within fifteen working days" from receipt of a citation. Sec. 10(a) Occupational Safety and Health Act of 1970.

The respondent presented evidence by affidavit that it received the citations in Chicago on April 1, 1980. According to the affidavit of the employee whose duties included handling incoming mail, all mail is duly time stamped as soon as it is received. The citations in both cases were time stamped April 1, 1980.

The citations were forwarded to respondent's legal department in Pittsburgh. Relying on the time stamp on the citations, the legal department filed the notices of contest on April 22, which was the 15th working day after April 1st.

The complainant, however, claims the citations were received by the respondent earlier than April 1st. In Docket No. 80-2281, complainant relies on a certified mail return receipt indicating delivery on March 31, and a return receipt in No. 80-2282 indicating delivery on March 28. According to complainant, this would make the notices of contest one and two working days late, respectively.

When issue was joined by the filing of an answer, complainant filed a motion in each case to strike the answer and to dismiss the notice of contest alleging as grounds the late filing. The motions were denied. The complainant moved for reconsideration. This was denied. A request for certification of an interlocutory appeal was likewise denied.

The complainant then petitioned for an interlocutory appeal under Commission Rule 75(c). That petition was unanimously denied by the Commission.

Thereafter the complainant filed a motion for summary judgment. Again the grounds asserted related to the alleged untimely filing of the notices of contest.

The question was briefed, and I thereafter ruled as follows:

> I find there is sufficient basis to conclude that respondent timely contested the citations within the 15 day working day period. See Newport News Shipbuilding & Drydock Co., 9 OSHC 1085 (1980). This conclusion not only finds support in the record, but is consistent with a Commission policy "in favor of deciding cases on their merits." Duquense Light Co., 8 OSHC 1218 (1980); Asarco, Inc., 8 OSHC 2156 (1980).

No reason or argument has since been advanced that would cause me to alter my position. In fact, that position is implicitly reinforced by several recent commission cases involving late filed notices of contest. In Branciforte Builders, Inc., 9 OSHC 2113, the Commission announced that "section 10(a) does not in all cases present an impenetrable barrier to Commission jurisdiction over a citation when the notice of contest is untimely." That case went on to authorize use of Rule 60(b) FRCP to relieve a party from strict compliance with the 15 day working day requirement. Commission policy now allows relief when it can be satisfactorily shown that tardy filing is due to "mistake, inadvertance surprise, or excusable neglect" or for "any other reason justifying relief." (See also J. I. Hass Co., Inc., 9 OSHC 2160; P & A Construction Company, Inc., 10 OSHC 1185).

## ORDER

The complainant having duly appeared at the time and place set for hearing of the above designated cases, and having declined to proceed with proof of the allegations in the citations and complaints herein, electing instead to stand or fall on the correctness of his

opinion that the Commission had no jurisdiction to proceed with a hearing; and the respondent having thereupon moved for dismissal upon grounds of complainant's failure to prosecute and failure to meet his burden of proof; and for good cause appearing, it is now

ORDERED that all proceedings in Docket No. 80-2281, including the complaint, citations and notices of penalty be, are the same are hereby in all things dismissed.

FURTHER ORDERED that all proceedings in Docket No. 80-2282, including the complaint, citations and notices of penalty be, and the same are hereby in all things dismissed.

## DECISION AND ORDER

BURROUGHS, Judge: Respondent, Structural Steel, Inc., contests an alleged serious violation of 29 C.F.R. § 1926.21(b)(2) for failure to instruct employees in the recognition and avoidance of unsafe conditions in the repair of a warehouse roof

and alleged nonserious violations of 29 C.F.R. § 1904.8, for failing to report a fatality, and 29 C.F.R. § 1926.100(a), for failure to require employees to wear protective helmets where a danger existed from falling objects. The alleged violations were set forth in a serious citation and "other" citation issued to respondent on August 3, 1981, after an investigation was conducted of a fatality occurring on July 10, 1981.

On July 1, 1981, respondent commenced the repair of a portion of the roof of the Ace Hardware warehouse located in Perrysburg, Ohio. A fire had damaged the roof, and respondent had been contracted to repair the damage. The warehouse was approximately 500 feet wide and 800 feet long. The roof of the building was approximately 50 to 60 feet above the floor of the warehouse.

On July 10, 1981, two employees, Tom Kralovic and Jack Juhasz, were laying corrugated steel decking on the bar joists. Two welders were following behind and tacking the decking. At the time of the accident, small sections of decking were being laid and tacked on both sides of an expansion joist that ran across the roof. The small sections of decking had been specially cut to fit the openings on both sides of the expansion joist. The decking sheets were approximately 5 feet 5 inches in length on one side of the expansion joist and 6 feet 4 inches on the other side of the joist. The decking was 30 inches wide.

Kralovic and Juhasz were laying the decking to cover the openings on each side of the expansion joist. The end of the sheets of decking located away from the expansion joist overlapped the existing decking by approximately six inches. The tongue and groove part of the decking interlocked with the existing decking at the points of overlap. The end of the sheet at the expansion joist was placed on the

bearing at the expansion joist. The bearing along the expansion joist varied from three quarters of an inch to an inch and a half.[1/]

The two welders were working seven to eight sheets behind Kralovic and Juhasz. Immediately prior to the accident, Kralovic and Juhasz had placed seven or eight sections of the decking on one side of the expansion joist and were in the process of shifting to lay out sheets on the other side of the joist. Kralovic straddled the expansion joist. A sheet of decking on which he was standing kicked or slid out from the bearing at the expansion joist. As the decking slid off the bearing, it tilted at the corner and Kralovic fell to his death through the opening. The sheet of decking did not fall through the opening.

## Alleged Violation of 29 C.F.R. § 1926.21(b)(2)

Complainant alleges respondent violated 29 C.F.R. § 1926.21(b)(2)[2/] by failing to conduct a pre-job meeting or conference to inform the employees of the hazards

---

1/ This dimension is disputed. One of the welders tacking the decking, Peter Kunz, testified that the width of the bearing along the expansion joist varied from three quarters of an inch to an inch and a half (Tr. 34). Respondent's ironworker foreman, John Shuboy, testified that there was a bearing of four and a half inches at the expansion joist on which the decking was placed (Tr. 104, 109). Shuboy's observation of the bearing at the expansion joist was limited. He indicated that "at times" he observed the laying of the decking (Tr. 103), but there is no indication that he personally observed the bearing along the expansion joist in question. There were also other expansion joists on the roof. Shuboy was the nonworking general foreman for the job (Tr. 101). The photograph introduced as Exhibit 1 reflects the bearing along the expansion joist. The expansion joist was composed of 2 x 12-inch pieces of lumber. The boards and the bearing along the expansion joist appear to be approximately the same width. In view of the photographic evidence and the fact that Kunz was involved in welding the decking to the bearing, his testimony as to the width is considered more credible.

2/ Section 1926.21(b)(2) provides:

> The employer shall instruct each employee in the recognition and avoidance of unsafe conditions and the regulations applicable to his work environment to control or eliminate any hazards or other exposure to illness or injury.

of working with short, lightweight pieces of roof decking suspended on only two joists with little bearing surface on one side. Complainant contends special precaution was necessary on this particular job because it involved the repair of fire damage. A fire repair job is generally considered more dangerous because of damage done to existing steel structure by the heat. The damaged steel has to be removed before the repair commences, and a danger arises from the cutting loose and removal of the damaged steel (Tr. 105-106, 110-111). At the time of the accident, the supporting structure had been repaired. Employees were laying and welding decking on the roof joists. There was nothing unusual about this aspect of the job except for the size and weight of the decking being used and the amount of bearing at the expansion joist.

Roof decking comes in lengths of 20 feet and will generally cover several bar joists when it is laid. In this case, the decking had been cut to lengths of approximately 5 feet 5 inches and 6 feet 4 inches. As a result of the short length, the sheets rested on only two joists. One end of each sheet rested on a bearing at the expansion joist that varied from only three quarters of an inch to one and one-half inches. The other end of each sheet overlapped existing decking by approximately six inches. The reduced size and weight of the decking sheets created a greater possibility that the sheets could slip off the bearing at the expansion joist.

The employees laying the decking were generally seven to eight sheets ahead of the welders. After the sheets were positioned in place on the joists, they remained loose until tacked down by the welders. Kralovic apparently stepped on one of these loose sheets during the course of his duties; the sheet slid and he fell through the created opening. The roof had been hosed down with water because of

the intense heat and to prevent sparks from the welding causing a fire. The water increased the slipperiness of the pieces of decking being secured to the roof.

The standard allegedly violated requires employers to instruct employees in the recognition and avoidance of unsafe conditions arising in their work environment. Complainant argues that a violation existed due to the lack of training as to a proper procedure to be followed in laying the decking. Although the employees engaged in laying and tacking down the decking had from ten to over twenty years' experience working on roofs, complainant submits that instructions were necessary because of the reduced size and weight of the sheets.

Shuboy and Kenneth Hintz, president of Northeast Erectors, both testified that the use of short lengths of decking is frequently required on a new roof job as well as a fire repair (Tr. 107, 111, 116). The use of short lengths on new roofs occurs because it is necessary to work around openings in the roof and the roof frame (Tr. 111-112, 116). Hintz did testify that where short lengths were being laid, he would instruct his welders to weld closer to where the decking was being laid (Tr. 117, 120). No such instruction was given to employees by respondent.

The amount of bearing on which the end of decking rests can also present a hazard. The bearing in this case has been determined to have varied from three quarters of an inch to an inch and a half. Hintz indicated that such a small bearing was unsafe. He testified (Tr. 121-122):

> Q. Would you say that having a piece of decking resting on one side with only an inch and a half of bearing is unusual?
>
> A. An inch and a half of bearing?
>
> Q. Yes.
>
> A. Yes, I would say that's unusual.
>
> Q. What hazard would you say that would present?

A. An inch and a half of bearing?

Q. Yes.

A. Well, I would say that that is not good.

Q. In what respect?

A. Well, it's not safe. I would say an inch and half of bearing would not be safe. I think the manual calls for something like two inches of bearing.

Hintz further stated that wet pieces of decking could have a tendency to slip. He testified (Tr. 122):

Q. If a roof was — when you are going through a decking procedure, if the roof was wet, what effect could that have on the conditions?

A. It's hazardous. You have got to be more careful.

Q. How does it increase the hazard?

A. The decks sometimes would get slippery. It's like walking on different types of ground. One is rough, one is smooth, the different types of concrete. Decking would be the same.

Q. The decking would be more like to slip or move?

A. Chances are in certain situations, yes, you would have a tendency to slip.

There is no dispute over the fact that the job could have been performed in a manner that would have increased employee safety. Employees could have been instructed as to the increased dangers resulting from the use of small lengths of decking and the fact there was a short bearing at the expansion joist on which one end of the decking was to be placed. Employees could also have been instructed to tack the sheets of decking as they were laid so there would at no time be any loose sheets of decking on which employees might have accidentally stepped (Tr. 16-17, 36, 48).

Respondent held no safety meetings with employees to discuss how the decking was to be laid. It hired the employees out of the local union hall and

simply assumed they knew how to do the job in a safe manner. Shuboy gave only general instructions for them to be careful, take their time and do a good job (Tr. 103). The laying of large numbers of small sheets of decking was unusual for a roof job,[3/] and the small bearing at the expansion joist was also unusual. The potential for an accident was increased by the fact that the roof had to be wet down because of the heat and danger from welding sparks that could cause a fire inside the warehouse. A safety meeting should have been held to discuss the job and insure that the employees were aware of the safest method to accomplish the job. The violation has been established.

Complainant alleges that the violation of 29 C.F.R. § 1926.21(b)(2) was serious within the meaning of section 17(k) of the Act.[4/] To establish a serious violation, the Secretary need only show that there is a substantial probability that death or serious physical harm could result from the violative condition and that the employer knew or, with the exercise of reasonable diligence, could have known of the presence of the violation. Wisconsin Electric Power Company, 76 OSAHRC 134/B2, 4 BNA OSHC 1783, 1976-77 CCH OSHD ¶ 21,234 (No. 5209, 1976). The

---

3/ The laying of small lengths around openings in a roof would not normally necessitate large numbers of small sheets being used. The small sheets in this case were being laid on both sides of an expansion joist for a long distance across the roof. The procedure followed by employees left more loose sheets than would normally be expected around an opening. Employees might also be more careful in laying small lengths around an opening since they can readily see they are exposed to a possible fall through the opening.

4/ Section 17(k) of the Act states:

> For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

Secretary need not prove that an accident is probable. It is sufficient if an accident is possible and its probable result would be serious injury or death. Brown & Root, Inc., Power Plant Division, 80 OSAHRC 17/B8, 8 BNA OSHC 1055, 1980 CCH OSHD ¶ 24,275 (No. 76-3942, 1980).

Respondent was familiar with the working conditions on the roof. The roof was located 50 to 60 feet above the floor of the warehouse. The probable consequences of a fall from this height is death or serious physical injury. The violation was serious.

The Commission is the final arbiter of penalties in all contested cases. Secretary v. Occupational Safety and Health Review Commission and Interstate Glass Co., 487 F.2d 438 (8th Cir. 1973). Under section 17(j)[5/] of the Act, the Commission is required to find and give "due consideration" to the size of the employer's business, the gravity of the violation, the good faith of the employer, and the history of previous violations in determining the assessment of an appropriate penalty. The gravity of the offense is the principal factor to be considered. Nacirema Operating Company, Inc., 72 OSAHRC 1/B10, 1 BNA OSHC 1001, 1971-73 CCH OSHD ¶ 15,032 (No. 4, 1972).

Two employees were laying the short lengths of decking along the expansion joist. They were working several sheets of decking ahead of the welders and were exposed to the hazardous conditions. The welders would have had little or no

---

5/ Section 17(j) of the Act states:

> The Commission shall have authority to assess all civil penalties provided in this section, giving due consideration to the appropriateness of the penalty with respect to the size of the business of the employer being charged, the gravity of the violation, the good faith of the employer, and the history of the previous violations.

exposure since they were tacking down the sheets of decking as they proceeded along the expansion joist. There is no evidence of previous history, and the gravity of the violation is not considered unusually high for the roofing industry. A penalty of $200 is assessed for the violation.

## Alleged Violation of 29 C.F.R. § 1904.8

Employee Tom Kralovic was killed on the job on July 10, 1981. The Occupational Safety and Health Administration received no report of the fatality from any employee of respondent. The fatality was reported to OSHA on July 10, 1981, by a representative of Ace Hardware. There is no dispute over these facts, and complainant contends the failure to report the fatality by respondent was a violation of 29 C.F.R. § 1904.8. Respondent argues that the reporting of the fatality by Ace Hardware should inure to its benefit.

Section 1904.8[6/] requires the employer of any employee killed from an employment accident to report the accident orally or in writing to the nearest office of the Area Director of OSHA within 48 hours after the occurrence. The duty to report the fatality is specifically imposed upon the employer. The report must relate the circumstances of the accident, the number of fatalities and the

---

6/ Section 1904.8 provides:

> Within 48 hours after the occurrence of an employment accident which is fatal to one or more employees or which results in hospitalization of five or more employees, the employer of any employees so injured or killed shall report the accident either orally or in writing to the nearest office of the Area Director of the Occupational Safety and Health Administration, U. S. Department of Labor. The reporting may be by telephone or telegraph. The report shall relate the circumstances of the accident, the number of fatalities, and the extent of any injuries. The Area Director may require such additional reports, in writing or otherwise, as he deems necessary, concerning the accident.

extent of any injuries. These facts are generally within the knowledge of the employer since he has control over the working environment.

Respondent submits that OSHA was timely notified on behalf of respondent by a representative of Ace Hardware. Respondent's brief states that Joseph Turnello, vice-president of respondent, specifically requested the Ace Hardware representative to make the communication to OSHA on behalf of respondent. While this may be respondent's interpretation of Joseph Turnello's testimony, his actual testimony was as follows:

> Q. Did you have any discussions with any parties other than your own employees at the jobsite regarding the accident?
>
> A. Yes, I talked to management from Ace Hardware.
>
> Q. And what discussions did you have with them?
>
> A. Well, we told them that we were going to be shutting — I told them — I said the men will actually not go back to work. That is something that we do in our trade, and I said we had — I asked the man and I asked my foreman, John Shuboy, I said has everybody been notified and he said yes.
>
> I said did you call the union hall and he said yes, and I said did you call the police and he said yes, and I said who else is there that you have called. We can't think of anybody else.
>
> I went back and talked to Ace Hardware and I told them who we had contacted and I said now, if there are any others, please contact them for us. And the employment comp we contacted from Michigan.

Turnello's testimony indicates that his foreman told him that everyone had been notified. The impression is left that neither one of them were aware of the requirement to report the fatality to OSHA. The conversation between Turnello and Ace Hardware representatives made no reference to the OSHA requirement.

There is no evidence that the employee of Ace Hardware reporting the fatality held any official position with the respondent or was officially delegated by

respondent to act on behalf of respondent in reporting the fatality to the Area Director of OSHA. Turnello's request to representatives of Ace Hardware to contact anyone else that had to be contacted made no specific reference to the OSHA requirement (Tr. 93). Ace Hardware was under no duty to report the fatality. The fact that it reported the fatality did not relieve respondent of its responsibility. The duty to report a fatality is imposed upon the employer. Since respondent did not report the death of Kralovic, the violation has been established.

Alleged Violation of 29 C.F.R. § 1926.100(a)

The warehouse was operational during the time respondent's employees were engaged in repairing the roof. Since welders were working on the roof, respondent stationed at least one employee inside the warehouse to be on the alert for the possibility of fires being started inside the warehouse. Complainant alleges that employees inside the warehouse were exposed to falling objects and were not wearing protective helmets as required by 29 C.F.R. § 1926.100(a).

Section 1926.100(a)[7/] requires employees working in areas where there is a danger of head injury from impact or from falling or flying objects to wear protective helmets. The alleged violation is based on the testimony of Lawrence E. LaBeau. He testified that on the day of the fatality he was working as a fire watchman in the warehouse below the area where work was being performed on the roof (Tr. 82-83). He stated that he wore a protective helmet only one day on the

---

7/ Section 1926.100(a) of 29 C.F.R. provides:

> Employees working in areas where there is a possible danger of head injury from impact, or from falling or flying objects, or from electrical shock and burns, shall be protected by protective helmets.

job and that the company did not furnish protective helmets. The helmet he wore on the one day was owned by Ace Hardware. There was a possibility of objects falling from overhead (Tr. 83-84, 86, 88).

LaBeau was the union steward on the job (Tr. 86). He testified that he was aware that employees were not wearing protective helmets but stated that he did not bring it to the attention of the supervisors because "it was too hot to wear a hard hat" (Tr. 87). There is no evidence that supervisory personnel acquiesced in the employee conduct. Shuboy testified that he was the nonworking general foreman for the job. He had two foremen under him that were provided by the local union (Tr. 100-101). According to Shuboy, employees working inside the warehouse had protective helmets and generally carried the helmets with them (Tr. 102). On a couple of occasions he observed employees working in the warehouse without wearing their protective helmets. He instructed them to wear the helmets, and the employees complied with his request (Tr. 102-103).

Respondent argues that it should not be held accountable for the failure of LaBeau to wear a helmet since it had done all that could reasonably be expected to prevent the violation. Where the existence of a violative condition has been shown, an employer may affirmatively defend by showing that the employee's behavior was a deviation from a uniformly and effectively enforced work rule. A. J. McNulty & Company, Inc., 76 OSAHRC 46/D2, 4 BNA OSHC 1097, 1975-76 CCH OSHD ¶ 20,600, (No. 2295, 1976). In order to establish such a defense, an employer must show that the employee's noncompliance with a standard was a departure from a work rule which the employer had uniformly and effectively enforced and the employer had neither actual nor constructive knowledge of the violation. B-G Maintenance Management, Inc., 76 OSAHRC 60/A2, 4 BNA OSHC 1282, 1976-77

CCH OSHD ¶ 20,744 (No. 4713, 1976); H. B. Zachry Company, 80 OSAHRC 9/D8, 7 BNA OSHC 2202, 1980 CCH OSHD ¶ 24,196 (No. 76-1393, 1980); aff'd 638 F.2d 812 (5th Cir. 1981).

An employer must show that it had an effective safety program designed to prevent the violation, including adequate safety instructions effectively communicated to employees, means of discovering violations of these instructions, and enforcement of safety rules when violations are discovered. Ocean Electric Corp., 75 OSAHRC 6 /C14, 3 BNA OSHC 1705, 1975-76 CCH OSHD ¶ 20,167 (No. 5811, 1975). Respondent's vice-president, Joseph Turnello, testified that respondent had a written safety program and that an employee is designated to look after OSHA matters (Tr. 95). There is no direct evidence that respondent had a work rule that required the wearing of protective helmets. The assumption can be made that such a rule was in existence since Shuboy testified that he instructed employees in the warehouse to wear helmets whenever he noticed they were working without wearing helmets. The mere establishment of work rules, however, is not sufficient to avoid responsibility for a violation. There must also be effective communication and enforcement of the work rule.

There is no evidence as to how respondent communicated the protective helmet requirement or any other of its safety rules to employees. The evidence indicates that all employees, with the exception of Shuboy, on this job were hired out of the union hall. There is no evidence to indicate that safety rules were discussed with employees when they first reported to work or at anytime during their employment on this job. Employees Peter Kunz and Jack Juhasz testified that no safety meetings were held with employees (Tr. 35, 67-68). Employee Lawrence LaBeau testified that the only safety meeting consisted of briefing

employees on how to hook on and unhook materials to and from a helicopter used to lift the materials to the roof (Tr. 84).

The evidence is lacking in details as to how safety rules were enforced. Shuboy apparently looked for violations whenever he inspected a job, but there is no direct evidence of respondent's enforcement scheme. Shuboy was a nonworking foreman who had two foremen under him. There is no evidence as to their authority for safety matters and no indication of whether they made an attempt to enforce safety rules. An effective enforcement program includes providing supervision adequate to detect violations of company work rules and the taking of disciplinary measures sufficient to discourage noncomplying conduct.

The record does not establish effective communication and enforcement of a work rule requiring the wearing of a protective helmet. Even after a liberal interpretation of the evidence that a work rule existed, the evidence concerning the implementation and enforcement of the rule is deficient. The violation has been established.

## FINDINGS OF FACT

1. On July 1, 1981, respondent commenced a roof deck repair job at the Ace Hardware warehouse located in Perrysburg, Ohio. The job was completed on July 12, 1981 (Tr. 91).

2. The warehouse was 500 feet wide and 800 feet long (Tr. 97). The roof of the warehouse was approximately 50 to 60 feet above the floor (Tr. 20).

3. The warehouse had an extensive roof fire sometime prior to July 1, 1981, and parts of the roof had to be replaced (Tr. 31).

4. Respondent had been contracted to repair that part of the roof that had been damaged by fire (Tr. 79).

5. On July 10, 1981, employee Tom Kralovic fell through the roof and was killed (Tr. 92).

6. The fatality was reported to the Area Director for OSHA on July 10, 1981, by an employee of Ace Hardware (Tr. 21, 93).

7. During the period from July 14, 1981, to July 16, 1981, Compliance Officer Thomas Buchele conducted an accident investigation at the warehouse (Tr. 8-10, 31). Respondent had completed its job at the time of inspection (Tr. 15, 20, 23).

8. At the time of the accident, decking was being laid on each side of an expansion joist which ran across the building. The decking had been cut to lengths of approximately 5 feet 5 inches and approximately 6 feet 4 inches to cover the openings on each side of the expansion joist (Exs. 1, 2; Tr. 34, 47, 69, 104). The decking was 30 inches wide (Tr. 104).

9. The expansion joist had been replaced by respondent (Tr. 97, 107).

10. A piece of steel had been welded underneath the expansion joist to obtain a bearing so that the decking could be welded to the expansion joist (Ex. 1; Tr. 60, 104).

11. The decking had to be placed on the bearing up to the expansion joist. There was no overlap of the decking at the expansion joist (Ex. 1; Tr. 44-45).

12. The bearing along the expansion joist on which one end of the decking was placed varied from three quarters of an inch to an inch and a half (Ex. 1; Tr. 34).

13. The end of the decking from the expansion joist was placed so that it overlapped the existing decking by approximately six inches (Exs. 1, 2; Tr. 42, 54, 64, 105). The tongue and groove part of the decking interlocked with the existing decking at the points of overlap (Ex. 2; Tr. 54-56).

14. On July 10, 1981, two employees, Tom Kralovic and Jack Juhasz, were laying the decking and two employees were following behind and tacking (Tr. 33,

68). The welders were generally working seven to eight sheets behind the employees laying the decking (Tr. 36, 41).

15. Immediately prior to the accident, Kralovic and Juhasz had laid out seven or eight sheets of decking on one side of the expansion joist and were in the process of shifting to position sheets on the other side of the joist. Kralovic straddled the expansion joist. A sheet of decking on which he was standing kicked or slid out from the bearing at the expansion joist, tilted at the corner and Kralovic fell through the opening (Tr. 42, 47, 59, 69-70, 73-74).

16. The decking was cut to the proper lengths on the roof. The area where the cutting was performed was wet down to avoid fires on the roof (Tr. 62, 70, 80).

17. Employees engaged in laying the decking and tacking it down were experienced ironworkers and had from ten to over twenty years' experience working on roofs (Tr. 19, 33, 67, 102).

18. When the accident occurred, all fire damage materials had been removed and discarded (Tr. 95).

19. Roof decking normally comes in lengths of 20 feet and covers several bar joists when placed on the roof (Tr. 68, 72).

20. The warehouse was in operation during the repair job. Materials were located in racks in the warehouse (Tr. 75).

21. An employee of respondent was working in the warehouse below the area where the decking was being welded. He was watching for fires that might be started from sparks emitted by the welding process. He wore a protective helmet on only one occasion while he worked in the warehouse (Tr. 82-83).

22. No safety meeting was held with employees, and no safety instructions were given to them prior to their commencing to lay the metal decking for the roof

(Tr. 10, 35, 67-68, 70). A briefing was given concerning the use of a helicopter to lift materials to the roof (Tr. 84).

## CONCLUSIONS OF LAW

1. Respondent, at all times material hereto, was engaged in a business affecting commerce within the meaning of section 3(5) of the Act.

2. Respondent, at all times material hereto, was subject to the requirements of the Act and the standards promulgated thereunder. The Commission has jurisdiction of the parties and of the subject matter.

3. Respondent was in violation of 29 C.F.R. § 1926.21(b)(2) for failing to instruct each employee working on the roof of the Ace Hardware warehouse during the period from July 1, 1981, to July 12, 1981, in the recognition and avoidance of unsafe conditions created by the use of short lengths of decking and the existence of a small bearing along an expansion joist. The violation was serious. A penalty of $200 is assessed for the violation.

4. Respondent was in violation of 29 C.F.R. § 1904.8 for failing to make an oral or written report to the Area Director of OSHA of the accident resulting in the death of employee Tom Kralovic on July 10, 1981.

5. Respondent was in violation of 29 C.F.R. § 1926.100(a) for failing to require and enforce the wearing of protective helmets by its employees stationed in the warehouse and below the workers on the roof to watch for the possibility of fires starting from sparks created by the welding equipment.

## ORDER

Based upon the foregoing findings of fact and conclusions of law, it is

ORDERED: (1) That the serious citation issued to respondent on August 3, 1981, is affirmed and a penalty of $200 is assessed for the violation; and

(2) That items one and two of the "other" citation issued to respondent on August 3, 1981, is affirmed.

Dated this 23rd day of February, 1982.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION
1114 MARKET STREET, ROOM 608
ST. LOUIS, MISSOURI 63101
(314) 425-5071

# NOTICE OF DECISION

Secretary of Labor v. Central Hardware Company,

OSHRC Docket No. 81-694

1. Enclosed is a copy of my decision. It will be filed with the Commission on February 24, 1982, and will become the final order of the Commission on March 26, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is March 26, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

F. Daley Abels

APPERANCES: KEITHLEY F. T. LAKE, Esquire, U. S. Department of Labor, Office of the Solicitor, 911 Walnut Street, Kansas City, Missouri
For the Complainant

RICHARD B. LINDENBERGER, Esquire, Ten Broadway, St. Louis, Missouri
For the Respondent

DECISION

In January and February 1981 Mark J. Banden, a compliance officer for the Occupational Safety and Health Administration (OSHA), inspected a hardware store owned and operated by respondent in St. Louis County, Missouri. Subsequently, OSHA issued citations 1 and 2 to respondent charging that respondent had violated several occupational safety and health standards promulgated by complainant under the provisions of the Occupational Safety and Health Act of 1970, 29 U.S.C. §651 et seq., (the Act). Respondent contested the alleged violations and complainant then filed his complaint before the Commission seeking affirmance of the charged violations. Citation 1 alleges that respondent seriously violated three occupational safety and health standards, and citation 2

alleges that respondent violated one occupational safety and health standard. The citations propose no penalties for three of the four alleged violations. The complaint likewise proposes no penalties for these same three alleged violations.

In its answer and by stipulation at the hearing respondent admits that it is engaged in a business affecting commerce, is an employer under the Act, and that the Commission has jurisdiction over this matter.

Respondent opened the hardware store in question in October 1980. In the store stockroom there is a certain DeWalt radial arm saw, which is the subject of the three alleged violations in citation 1. Also in the stockroom is a certain table saw which, along with the radial arm saw and other saws are the subject of the violation alleged in citation 2.

On the days that Mr. Banden inspected the saws in question there was no blade guard on one side of the lower half of the DeWalt radial arm saw. He determined, by conversation with employees who used the saw, that this portion of the blade guard had never been on the saw since the store opened in October 1980. Employees Robert Powell and Robert J. Slinger, who were lumber cutters at the store and used the saw intermittently on a daily basis, had seen a guard on only one side of the saw at all times that it had been in use since the store opened.

Charles Tipton, respondent's store manager, stated that when the saw was installed in October 1980 it had all of the factory installed guards on it, that no management or supervisory personnel had ever authorized removal of any guarding device, and that no employee had ever complained to him of the saw being unguarded. He never knew the guard was missing until informed of that fact by Mr. Banden on the day of the

inspection. In the regular course of his duties he would be in the area where the saw was located ten to fifteen times a day, would pass within five or ten feet of the location where the saw was being operated, and stated that the guard in question would be easily visible if he looked at the saw. His concept of being a store manager would require that he inspect equipment in use, such as the saw in question, to be sure that it is kept in an approved or safe manner.

In item 1A of citation 1 complainant charges respondent with a violation of 29 CFR 1910.213(h)(1) in that the DeWalt radial arm saw had the guard removed from the west side of the saw blade. The standard provides in substance and in pertinent part that the sides of the lower exposed portion of the blade of a radial saw shall be guarded to the full diameter of the blade by a device that will automatically adjust itself to the thickness of the stock and remain in contact with stock being cut to give maximum protection possible for the operation being performed.

There is no factual dispute as to the absence of a guard on the lower right half of the saw blade. The compliance officer testified that the absence of this portion of the guard presented a hazard to an employee using the saw in that if a portion of the employee's body came into contact with the unguarded blade it could result in laceration or amputation. Respondent contends that even though the guard is missing, protection is afforded the operator by means of guarding by location. Respondent states that since the right hand of the operator is on the handle while the saw is in operation there is very little, if any, possibility of encountering any hazard from the unguarded right side of

the saw blade. This contention assumes that in all instances an operator of the saw will use the right hand to activate the saw and the left hand to steady the work on which the saw is being used. There is no evidence that the saw cannot be operated with the right hand steadying the material and the left hand on the handle. In such a situation there would be no guarding by location as envisioned by respondent. Without the guard in question prevention of injury by means of the unguarded blade is based solely on respondent's reliance that its employees will operate the saw at all times in the manner envisioned by it. With the blade in its unguarded position, it is possible for an employee to have a hand or finger come into contact with the blade while the saw is in operation. Although the hazard may be remote, it does exist. In such a situation the standard has been violated. H. B. Zachry Company, 80 OSAHRC 69/A2, 8 BNA OSHC 1669, 1980 CCH OSHD ¶24,588 (No. 76-2617, 1980).

Item 1B of citation 1 charges that the same radial saw was not provided with an adjustable stop to prevent the forward travel of the blade beyond the position necessary to complete the cut in repetitive operations, in violation of 29 CFR 1910.213(h)(3). The charge incorporates the language of the standard.

The compliance officer and the two stockroom employees who used the saw all testified that the saw was not equipped with an adjustable stop, and therefore the saw was allowed to come forward when in use so that the edge of the saw blade was at or slightly past the edge of the table on which the saw was mounted. Respondent did not actually contradict this testimony. The store manager simply stated that he was unaware

that there was no such stop on the saw. According to the compliance officer, the hazard to employees consisted of the saw coming into close proximity to the operator because of the absence of the stop.

The evidence definitely establishes that there was no adjustable stop on the saw in question. Respondent contends that even though there was no stop the standard was not violated because, by its terms, it applies only "in repetitive operations". Respondent states that in order for the standard to be applicable a situation must exist such as that which might be found in a manufacturing facility where a number of pieces of lumber is being cut all to the same size on a continuous basis. Respondent arrives at this conclusion by adopting definitions contained in Websters New World Dictionary, Second College Edition, 1972. Therein the word repetitive is defined as "of or characterized by repetition", and repetition is defined as "the act of repeating; a doing again, or again and again". Respondent states that there is no testimony in this record that any cutting was performed on a continuous again and again basis within the meaning of the phrase "in repetitive operations".

In advancing this contention respondent overlooks the testimony of its lumber cutter, Robert Powell, who stated that at the time in question he would be using the saw three-quarters of the time during the day. Respondent also overlooks the testimony of its other lumber cutter, Robert J. Slinger, who stated that he used the saw three to six times per hour. Finally, respondent's store manager, Charles Tipton, testified that although the saw was used to cut different sizes of lumber, the motion of cutting would be the same and that a person who

had to do the same motion time and time again would be engaged in repetitive activity.

Given the purpose of the Act (to assure as far as possible safe and healthful working conditions for employees), the testimony of the employees as to the frequency of use of the saw and the admission of respondent's managerial employee that such use would be repetitive in nature belie respondent's contention, and a violation of the standard must be found by reason of the absence of the adjustable stop.

Item 1C of citation 1 charges respondent with a violation of 29 CFR 1910.213(h)(4) in that the radial saw in question was not installed in a manner so as to cause the cutting head to return gently to the starting position when released by the operator. The standard provides in pertinent part that installation of a radial saw shall be in such a manner that the front end of the unit will be slightly higher than the rear so as to cause the cutting edge to return gently to the starting position when released by the operator. Witnesses Banden, Powell, and Slinger all testified that the saw would not return to its starting position when released by the operator. Witness Tipton was not aware of this defect in the saw until the inspection was made by Mr. Banden. Banden further stated that the outer edge of the saw arm could be elevated in such a way that by gravity the head would return to the starting position or, as with this saw, there was an adjustable spring tension return which would accomplish the same thing. However, the spring tension device on this saw was not operable.

The gist of Banden's testimony is that if the tension spring device were operable the saw would not be in violation of the standard. The

standard, however, does not provide for the use of a spring tension device to return the head to the starting position. It very clearly and specifically requires that the saw be installed with the front end slightly higher than the rear so as to cause the return of the head. Banden did not make any measurements as to the height of the front end of the unit as compared to the rear end. He offered no testimony as to whether or not the front end of the saw was slightly higher than the the rear end, and there is no other evidence as to the manner of installation and as to whether or not the saw was installed with the front end slightly higher than the rear. Complainant has the burden of proving all of the necessary elements, and there is simply a lack of proof with regard to the height of the front end of the saw as compared to the rear. Accordingly, complainant has not sustained his burden and a violation has not been established.

Item 1 of citation 2 charges respondent with not requiring the lumber cutters in the stockroom to wear protective eye equipment where there was a reasonable probability of injury from flying particles generated by the table and radial arm saws when such injury could be prevented by the use of such equipment. Complainant alleges that this is a violation of 29 CFR 1910.133(a)(1). The standard provides in substance and as here pertinent that protective eye equipment shall be required where there is a reasonable probability of injury that can be prevented by such equipment. It enjoins employers to make conveniently available a type of protector suitable for the work to be performed and enjoins employees to use such protectors. It further provides that suitable eye protectors shall be provided where machines or operations

present the hazards of flying objects.

On the day of the inspection, Mr. Banden noted that the employees working in the stockroom at the saws were not wearing eye goggles or safety glasses. The DeWalt radial arm saw and a table saw were throwing particulates into the air with use. Neither of the saws was provided with any type of local exhaust ventilation to capture particulates during the cutting of materials. Powell testified that goggles were available in the storeroom, and that whenever an employee needed to use goggles he could go to the storeroom and get them and they were readily available. He was aware of no management rule that goggles had to be worn on certain saws or for certain types of operations. The wearing of goggles or not was left to the employee's discretion. Powell sometimes used goggles when operating the radial saw and used them most of the time when operating the table saw. According to Slinger there was no requirement that eye equipment be worn while using either the radial saw or the table saw. He had never been instructed by any management personnel to wear eye equipment during cutting operations. He was not aware of any safety goggles present in the work location that he could use during the cutting operation at any time before the inspection.

Store manager Tipton testified that on occasion he would see employees working in the area of the saws who were not wearing safety glasses or eye goggles. He took no disciplinary action against any employee for not wearing eye protection. Goggles were available for use by the employees.

Complainant contends that failure of respondent to compel the employees to wear safety glasses or eye goggles while using the saw is a

violation of the standard in question. There is no doubt from the testimony that the saws did discharge dust and particulates into the atmosphere. During a cut by employee Slinger, the compliance officer stood directly behind him taking an air sample and was struck in his safety glasses by particulates coming from the saw. Use of the saws without appropriate eye protective equipment definitely creates a hazard insofar as the employees are concerned. Respondent tacitly concedes a violation, since it directs no part of the argument in its brief toward this charge. Apparently it relies on the proposition that goggles were available to the employees for use at their discretion. Respondent's failure to take affirmative action to compel use of the protective equipment by the employees is a dereliction of its duty under the standard and constitutes a violation of the standard.

Complainant charges that the established violations under items 1A and 1B of citation 1 are serious violations under the Act. Complainant proposes a $630.00 penalty for the item 1A violation and proposes no penalty for the item 1B violation. Under section 17(k) of the Act, a serious violation exists if there is a substantial probability that death or serious physical harm could result from the violative condition unless the employer did not and could not with the exercise of diligence know of the presence of the violation. With respect to items 1A and 1B the testimony of witness Tipton as to his daily presence in the stockroom and his observance of the radial saw establishes the fact that respondent should have known of the presence of the violative condition. Banden's testimony as to the injuries that could result from the violative conditions establishes that there is a substantial probability

that serious physical harm could result therefrom. The record establishes therefore that these violations are serious within the meaning of the Act.

Section 17(b) of the Act provides that a civil penalty of up to $1,000.00 shall be assessed for each serious violation. Section 17(j) directs me in assessing the civil penalties for these violations to give due consideration to the appropriateness of the penalty with respect to the size of the business of the employer, the gravity of the violation, the good faith of the employer, and the history of previous violations.

As to the size of respondent's business, it is alleged in paragraph 2 of the complaint that respondent employs approximately 1,000 employees in its various business activities and approximately 100 employees at the hardware store in question. This allegation is denied by respondent in its answer, and there is no evidence as to the size of respondent's business.

Absent any unusual circumstances the gravity of the violations ordinarily deserves to be given more weight than the other factors. As to gravity, elements to be considered include 1) the number of employees subjected to the hazard, 2) the duration of exposure, 3) the precautions taken against injury and 4) the degree of probability that an injury would occur. Morrison-Knudsen and Associates, 80 OSAHRC 108/A2, 8 BNA OSHC 2231, 1980 CCH OSHD, ¶24,953 (No. 76-1992, 1980). Two employees were subjected to the hazard for up to 75 percent of the work day, no precautions were taken against injury, and the degree of probability that an injury would occur was very slight because of the long experience of these employees.

Respondent evidenced some degree of good faith by correcting these violations although the corrections were not made as soon after the inspection as they could have been. There is no history of previous violations.

Since the gravity of the violations is moderate, there is some evidence of good faith, and no evidence as to the size of respondent's business or a history of previous violations, a civil penalty of $200.00 for each of these violations is appropriate after giving due consideration to all of the relevant factors. It should be noted that although no penalty is proposed by complainant for item 1B it is mandatory under section 17(b) that a penalty be assessed.

With regard to item 1 of citation 2, complainant proposes no penalty and a consideration of all of the relevant factors leads to the conclusion that no penalty should be assessed for this violation.

A careful and considerable evaluation of the pleadings, the evidence adduced, the briefs of the parties and the applicable law leads to the following findings of fact and conclusions of law:

## FINDINGS OF FACT

1. It has been admitted that the Commission has jurisdiction in this matter.

2. Respondent owns and operates a certain hardware store in St. Louis, County, Missouri, having operated the store since October 1980.

3. In January and February 1981, in the stockroom of said hardware store, respondent's employees operated a DeWalt radial arm saw, a table saw, and other radial arm saws owned and supplied by respondent.

4. The DeWalt radial arm saw was used by respondent's employees

since October 1980 through January and February 1981, when respondent's premises were inspected by a representative of the Occupational Safety and Health Administration.

5. At the time of the inspection, there was no blade guard on one side of the lower half of the DeWalt radial arm saw, nor was there an adjustable stop on said saw to prevent the forward travel of the blade beyond the position necessary to complete a cut in repetitive operations.

6. Because of the absence of an adjustable stop, the saw was allowed to come forward when in use so that the edge of the saw blade was at or slightly past the edge of the table on which the saw was mounted.

7. The absence of a portion of the guard and the absence of the adjustable stop presented a hazard to an employee using the saw in that a portion of the employees body could come into contact with the unguarded blade resulting in laceration or amputation.

8. In the regular course of his duties, respondent's store manager would be in the area where the DeWalt saw was located ten to fifteen times a day, would pass within five or ten feet of the location where the saw was being operated, and could easily see the saw guard if he looked at the saw.

9. The DeWalt radial arm saw was used by one of respondent's lumber cutters three-quarters of the time during a working day and by another lumber cutter three to six times per hour during a working day.

10. Respondent's store manager was of the opinion that although said saw was used to cut different sizes of lumber the motion of cutting would be the same, and a person who had to do the same motion time and

time again would be engaged in repetitive activity.

11. There is no evidence as to the manner of installation of the DeWalt radial arm saw, and no evidence as to whether or not the front end of the saw was slightly higher than the rear end.

12. Use of the DeWalt radial arm saw, the table saw, and other radial arm saws in respondent's stockroom caused dust and particulates to be discharged into the atmosphere in the stockroom.

13. Eye goggles were available in the storeroom for employee use, but the use of eye goggles was left to employee discretion.

14. There was no management requirement that employees use eye goggles when operating the radial saws or the table saw, and the lumber cutters had never been instructed by any management personnel to wear eye equipment during cutting operations.

15. On occasion the store manager had seen employees working in the area of the saws who were not wearing safety glasses or eye goggles but had never taken any disciplinary action against any such employee.

16. With respect to items 1A and 1B of citation 1, several employees were exposed to the hazard of serious physical injury by reason of the violative conditions contained in said items.

17. Complainant does not seek imposition of a civil penalty for item 1B of citation 1.

## CONCLUSIONS OF LAW

1. At all times relevant herein, respondent was an employer engaged in a business affecting commerce within the meaning of the Act, and the Commission has jurisdiction over the subject matter and the parties.

2. Respondent violated 29 CFR 1910.213(h)(1) by not guarding the lower exposed portion of the DeWalt radial arm saw to the full diameter of the blade.

3. Respondent violated 29 CFR 1910.213(h)(3) by not providing the DeWalt radial arm saw with an adjustable stop to prevent the forward travel of the blade beyond the position necessary to complete the cut in repetitive operations.

4. The previously mentioned violations are serious in nature in that there was a substantial probability that serious physical harm could result therefrom.

5. Respondent violated 29 CFR 1910.133(a)(1) in that it did not require protective eye equipment where there was a reasonable probability of injury that could be prevented by the use of such equipment.

6. Respondent did not violate 29 CFR 1910.213(h)(4).

7. Since the violation contained in item 1B of citation one is a serious violation within the meaning of the Act, a penalty must be imposed even though complainant has prayed no penalty for such violation.

## ORDER

Based upon the foregoing findings of fact and conclusions of law, it is hereby ORDERED:

1. Citation 1, item 1A, is affirmed and a civil penalty in the amount of $200.00 is assessed thereon.

2. Citation 1, item 1B, is affirmed and a civil penalty in the amount of $200.00 is assessed thereon.

3. Citation 1, item 1C, is vacated.

4. Citation 2, item 1, is affirmed and no penalty is assessed

thereon.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>CRAWFORD CONSTRUCTION COMPANY, INC.,<br><br>Respondent. | OSHRC Docket No. 79-928 |

DECISION

Before: ROWLAND, Chairman; CLEARY AND COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge John S. Patton is before the Commission for review under 29 U.S.C. § 661(i), section 12(j) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). The Secretary of Labor ("the Secretary") issued a citation to the Respondent, Crawford Construction Company, Inc. ("Crawford"), alleging a willful violation of section 5(a)(2) of the Act, 29 U.S.C. § 654(a)(2), for failure to comply with the construction safety standard at 29 C.F.R. § 1926.652(b). Crawford timely contested the citation and a hearing was held before Judge Patton. In his post-hearing brief, the Secretary moved to amend the citation under Rule 15(b) of the Federal Rules of Civil Procedure to allege noncompliance with 29 C.F.R. § 1926.652(c) instead of section 1926.652(b). 1/ In his decision Judge Patton denied the Secretary's

---

1/ Sections 1926.652(b) and (c) provide:

> (b) Sides of trenches in unstable or soft material, 5 feet or more in depth, shall be shored, sheeted, braced, sloped,

(Footnote cont'd)

motion to amend and vacated the citation. The Secretary petitioned for review of the judge's decision and Commissioner Cleary directed review on the following issues:

> (1) Whether the administrative law judge erred in denying the Secretary's motion to amend the complaint to allege a violation of 29 CFR §1926.652(c); and
>
> (2) Whether [Crawford] would be prejudiced if the amendment of the complaint is allowed.

I

Crawford was laying a sewer line near Galion, Ohio, in February, 1979, when its worksite was inspected by a compliance officer of the Occupational Safety and Health Administration ("OSHA"). When the compliance officer arrived, Crawford was reopening a portion of the trench that had been filled a few days earlier. The pipe in the trench was off grade and had to be relaid. The open portion of the trench was dug across a state highway.

Crawford had begun reopening the trench that morning and had finished excavating about an hour before the compliance officer arrived. After Crawford completed excavating, but before the compliance officer arrived, Crawford had shored a portion of the walls of the trench, regraded part of the trench floor, and relaid some of the sewer pipe. When the compliance officer arrived, the

---

(Footnote 1 cont'd)

> or otherwise supported by means of sufficient strength to protect the employees working within them. See Tables P-1, P-2 (following paragraph (g) of this section).
>
> (c) Sides of trenches in hard or compact soil, including embankments, shall be shored or otherwise supported when the trench is more than 5 feet in depth and 8 feet or more in length. In lieu of shoring, the sides of the trench above the 5-foot level may be sloped to preclude collapse, but shall not be steeper than a 1-foot rise to each 1/2-foot horizontal. When the outside diameter of a pipe is greater than 6 feet, a length of 4-foot minimum shall be provided at the toe of the sloped portion.

employees were gathering plywood to put in more shoring along the walls of the trench.

The trench was approximately 32 feet long, 10 feet 3 inches deep, and 3 feet 4 inches wide. It had vertical walls. There was about a foot of blacktop and macadam base at the top of the trench walls. Below that was 20 to 24 inches of frozen soil, so the trench was frozen to approximately 3 feet below ground level. When the trench was dug, Crawford had cut through a storm sewer that was discharging water into one end of the trench. That end was shored, and a sump pump in the trench kept the water from accumulating. The weather was cold and windy. Snow had fallen earlier in the day, but the sun had come out by the time of the inspection. Although the temperature was still below freezing, the sun was melting the snow.

The compliance officer looked at the walls of the trench and the material that had been removed from the trench. He attempted to take a soil sample from the trench walls but could not get one because the earth within his reach was frozen hard.

The compliance officer observed an employee attempting to shore the walls. The employee was having difficulty because the bottom of the trench was wet and slippery. When the compliance officer suggested to the employee in charge, Mr. Sand, that it would be easier to protect employees if a nearby trench box was used instead of shoring, Mr. Sand immediately had the trench box brought to the trench and fit into the portion of the trench where the employees were working.

At the hearing before Judge Patton, the compliance officer expressed the opinion that the soil in the walls of the trench was "sandy." He testified that he had told Mr. Sand that a trench more than five feet deep must be shored or sloped. The compliance officer stated that he asked Mr. Sand why the walls were

not shored or sloped, and that Mr. Sand replied that the employees were not expected to be in the trench very long.

Three Crawford employees, Mr. Sand and two workmen who were at the site during the inspection, testified. All three stated that they had been familiar with OSHA's trenching standards before the inspection. They all testified that the soil in the walls of the trench was hard blue clay and was frozen to a depth of about three feet. They testified that they had discussed whether it was necessary to use the trench box and had decided that, under the conditions at that time and place, it was not necessary.

Mr. Sand testified that they had been using the trench box all along except for the portion of the trench across the road. He testified that the frozen earth at the top of the trench walls would be just as hard as stone or concrete. When asked whether he believed that the trench complied with OSHA's trenching requirements, Mr. Sand testified that he "thought it was safe." He stated that the employees had been shoring the trench walls that day but had relaid the pipe up to the end of that shoring when the compliance officer arrived, and that the employees were getting more plywood to extend the shoring.

Mr. Sand testified that the earth originally removed from the trench had been taken away and that a sandy fill had been brought in from somewhere else. He testified that some of the sandy fill might have been frozen to the walls of the trench when the trench was reopened. The material that had been removed from the trench that day was fill, not the original soil.

The other two Crawford employees who testified agreed that the temperature was still below freezing at the time of the inspection. They both testified that the water in the trench was snow melted by the sun and that it had come in through the broken storm sewer. They stated that the pump was preventing the water from accumulating. They stated that some of the difficulty the compliance

officer observed with the shoring occurred because some of the bracing was knocked out by the pipe when it was relaid.

Crawford also presented as an expert witness an engineer who specializes in soil mechanics and engineering geology. He testified that frozen soil does not have the same properties as soil that is not frozen, and that freezing bonds the soil, affording greater stability. He testified that freezing the soil is a common and accepted practice to make the walls of excavations more stable and that frozen soil may be considered "cemented." He testified that, in his opinion, the walls of the trench in question could be vertical because of the frozen soil.

II

After the hearing, the Secretary moved in his post-hearing brief to amend the pleadings under Rule 15(b) of the Federal Rules of Civil Procedure 2/ to

---

2/ Rule 15(b) of the Federal Rules of Civil Procedure is made applicable to Commission proceedings by section 12(g) of the Act, 29 U.S.C. § 661(f), and Rule 2(b) of the Commission's Rules of Procedure, 29 C.F.R. § 2200.2(b). It provides:

> Rule 15. Amended and Supplemental Pleadings.
>
> * * *
>
> (b) AMENDMENTS TO CONFORM TO THE EVIDENCE. When issues not raised by the pleadings are tried by express or implied consent of the parties, they shall be treated in all respects as if they had been raised in the pleadings. Such amendment of the pleadings as may be necessary to cause them to conform to the evidence and to raise these issues may be made upon motion of any party at any time, even after judgment; but failure so to amend does not affect the result of the trial of these issues. If evidence is objected to at the trial on the ground that it is not within the issues made by the pleadings, the court may allow the pleadings to be amended and shall do so freely when the presentation of the merits of the action will be subserved thereby and the objecting party fails to satisfy the court that the admission of such evidence would prejudice him in maintaining his action or defense upon the merits. The court may grant a continuance to enable the objecting party to meet such evidence.

conform to the evidence. The Secretary moved to allege noncompliance with 29 C.F.R. § 1926.652(c) instead of section 1926.652(b), the originally cited standard. The citation as it was proposed to be amended would have alleged that the soil was hard or compact rather than soft or unstable.

In his decision, Judge Patton denied the motion to amend and vacated the citation. The judge found that the soil was hard or compact, not soft or unstable as alleged, and that the citation must therefore be vacated. Judge Patton denied the motion to amend because he found that Crawford had not consented to try the issue of whether failure to shore or slope a trench dug in hard soil was a violation. The judge reasoned that because the evidence proving noncompliance with the uncited standard also went to the issue of noncompliance with the cited standard, Crawford's failure to object to the evidence of the nature of the soil could not be construed as consent to try the unpleaded issue. He therefore found that the amendment requested by the Secretary was not permitted by Federal Rule 15(b) and vacated the citation.

III

The Secretary petitioned for review of the judge's decision, arguing that amendment to conform the pleadings to the evidence is proper when the factual questions tried by the parties are material to both legal theories. The Secretary asserts that the change in legal theory here is minor.

The Secretary argues that Crawford not only consented to try the question of whether the soil was hard, but it based its defense on the fact that the soil was hard. Since no shoring or sloping was used in the cited portion of the trench, the Secretary asserts, the facts establish that Crawford failed to comply with either standard. Therefore the Secretary argues that Crawford's defense that the soil was hard would not justify its failure to take protective measures for its employees working in the trench, and Crawford cannot claim that

it would be prejudiced by granting the amendment to allege noncompliance with section 1926.652(c).

Crawford asserts that the record must clearly show that the parties understood that they were trying an unpleaded issue in order for a post-trial amendment to be permitted under Rule 15(b), and that consent cannot be inferred from the introduction of or failure to object to evidence relevant to both the pleaded and unpleaded issues. Even if the amendment is permitted, Crawford argues, it was in compliance with section 1926.652(c) because the frozen earth did not need to be shored or sloped. Crawford asserts that the record establishes that frozen soil is of equal stability as cemented soil, which need not be shored or sloped under the tables accompanying section 1926.652.

IV

It is well established that administrative pleadings are liberally construed and easily amended. Usery v. Marquette Cement Mfg. Co., 568 F.2d 902 (2d Cir. 1977); National Realty & Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973). Under Rule 15(b) the pleadings are to be amended if an unpleaded issue has been tried with either the express or implied consent of the parties. Consent will be implied where the party opposing amendment has introduced or failed to object to evidence relevant to the unpleaded issue and that party would not be prejudiced by the amendment; that the evidence introduced is relevant to both the pleaded and unpleaded issues is not controlling as long as the amendment is not prejudicial. See Vicon Corp., 81 OSAHRC 98/C4, 10 BNA OSHC 1153, 1157, 1981 CCH OSHD ¶ 25,749, p. 32,159 (No. 78-2923, 1981), appeal filed, No. 81-2359 (8th Cir. December 10, 1981); Bill C. Carroll Co., 79 OSAHRC 87/C13, 7 BNA OSHC 1806, 1809, 1979 CCH OSHD ¶ 23,940, p. 29,032 (No. 76-2748, 1979); Mississippi Power & Light Co., 79 OSAHRC 109/D12, 7 BNA OSHC 2036, 2040, 1980 CCH OSHD ¶ 24,146, p. 29,341 (No. 76-2044, 1979); Mineral Industries & Heavy Construction Group, 639 F.2d 1289, 1293 (5th Cir. 1981).

Applying these principles to the case before us, we find that the amendment sought by the Secretary would introduce a new legal theory; it would not raise any new questions of fact. The parties tried the factual issues relevant to the unpleaded allegation--the nature of the soil and whether the trench walls were supported. Mr. Sand and the two workmen, Crawford's own witnesses, testified that the soil was hard, blue clay that was frozen to a depth of about three feet; and its expert testified that the frozen soil could be considered "cemented" within the meaning of the tables accompanying section 1926.652. We therefore conclude that the amendment should be permitted unless Crawford would be prejudiced by the amendment.

We find that Crawford's ability to prepare and present its case was not impaired by the change in legal theory. As we have said, the nature of the soil was fully litigated. Although the question of prejudice was specifically directed for review, and Crawford opposes the amendment in its brief, it does not make any claim of prejudice. Crawford has not asserted that there is any additional evidence that it would have presented if the amendment had been made before the hearing. Indeed, Crawford argues that if the amendment is permitted the evidence shows that it was not in violation under the amended allegations. We are therefore unable to find that Crawford will suffer prejudice from the amendment. The motion to amend is granted.

Although we have resolved the issues specified in the direction for review, it is still necessary to determine whether Crawford was in compliance with section 1926.652(c), as it claims. In the interests of adjudicative efficiency, the Commission will make the necessary determinations itself instead of remanding the case to the administrative law judge. The record before us is complete and the Commission has the ultimate authority to make findings of fact. Franklin R. Lacy, 81 OSAHRC 7/A2, 9 BNA OSHC 1253, 1981 CCH OSHD ¶ 25,170 (No. 3701, 1981), citing Accu-Namics, Inc. v. OSHRC, 515 F.2d 828, 834 (5th Cir. 1975), cert. denied, 425 U.S. 903 (1976).

V

Section 1926.652(c) requires that the walls of trenches more than 8 feet long and 5 feet deep that are dug in hard or compact soil be shored or, if shoring is not used, the portion of the walls greater than five feet from the bottom of the trench be sloped. Horowitz Brothers, Inc., 75 OSAHRC 54/E5, 3 BNA OSHC 1131, 1974-75 CCH OSHD ¶ 19,596 (No. 3004, 1975). It is undisputed that the walls of the trench were vertical and that Crawford employees were working in a part of the trench where the walls were unshored. The judge found that the soil in the walls of the trench were frozen to a depth of two to three feet, and that below the frozen soil the sides were composed of blue clay, which is hard and compact soil. These findings, which are supported by a preponderance of the evidence, establish a prima facie showing of noncompliance with that standard. CCI, Inc., 80 OSAHRC 127/D4, 9 BNA OSHC 1169, 1981 CCH OSHD ¶ 25,091 (No. 76-1228, 1980), appeal filed, No. 81-1218 (10th Cir. Feb. 25, 1981). The Secretary's prima facie showing may be rebutted by showing that the trench in question was excavated entirely in solid rock, shale, or cemented sand or gravel, which, under the tables accompanying section 1926.652, are not required to be sloped or shored. Id. We find that the Secretary's showing has not been rebutted.

Crawford claims that because the soil was frozen, it was as stable as "cemented sand" and that it therefore required no shoring or sloping. Even if we were to share Crawford's assumption that frozen soil need not be sloped or shored, the fact remains that the soil was frozen only to a depth of three feet. The remainder was composed of unfrozen clay, which was hard or compact soil. The Commission has held that trenches must comply with section 1926.652(c) if a significant portion of the trench walls are hard or compact soil. See CCI, Inc., 9 BNA OSHC at 1173, 1981 CCH OSHD at 30,994; cf. W.N. Couch Construction Co., 76

OSAHRC 44/A2, 4 BNA OSHC 1054, 1056, 1975-76 CCH OSHD ¶ 20,574, p. 24,592 (No. 7370, 1976) (§ 1926.652(b) applies if there is a significant amount of soft or unstable soil). We consider seven feet of hard soil to be a significant amount. We therefore find that Crawford was not in compliance with section 1926.652(c).

VI

The Secretary alleged that the violation was willful. A violation is willful if it was committed with either an intentional disregard of the requirements of the Act or a plain indifference to them. Mel Jarvis Construction Co., 81 OSAHRC ____, 10 BNA OSHC 1052, 1981 CCH OSHD ¶ 25,713 (No. 77-2100, 1981). The record here does not demonstrate that Crawford acted with either intentional disregard of or plain indifference to the requirements of the Act.

Crawford had used the trench box throughout the job except when it reopened the trench across the road. It is evident from his testimony that Mr. Sand reasonably and in good faith believed that the frozen soil added stability to the trench walls. Even so, Crawford generally used shoring. The portion of the trench where water entered through the broken storm sewer was shored, and the employees were preparing to extend the shoring when the compliance officer arrived. Under these circumstances, we do not construe the statements of Mr. Sand to the compliance officer or the testimony of Crawford's employees as demonstrating that they knew they were in violation but did not care.

VII

A willful violation was alleged. Where a violation is alleged to be willful but is not proved to be so, an other than serious violation may be affirmed; a serious violation may not be found unless the parties have expressly or impliedly consented to try the issue of whether the violation was serious. Toler Excavating Co., 75 OSAHRC 76/C8, 3 BNA OSHC 1420, 1975-76 CCH OSHD ¶ 19,875 (No. 2637,

1975). Here, the compliance officer testified without objection that there was a high probability of fatality if a cave-in occurred. Although that testimony was presented for the purpose of describing the gravity of the violation, the parties tried all the factual issues relevant to a serious violation. We therefore amend the pleadings to allege a serious violation.

We find that the violation was serious within the meaning of section 17(k) of the Act, 29 U.S.C. § 666(j), which states that a violation shall be deemed serious "if there is a substantial probability that death or serious physical harm could result . . . . " The trench was over ten feet deep, well above the head of any employee working in the bottom of the trench. The compliance officer testified that if the walls should collapse there was a high probability of a fatality. The record is clear that Crawford had knowledge of the violative condition. This evidence shows that the violation was serious.

In assessing a penalty, we must consider the factors set forth in section 17(j) of the Act, 29 U.S.C. § 666(i): the gravity of the violation, the employer's size, good faith, and history of previous violations.

Crawford is a small company, with only 20 employees. It has no history of previous violations. It generally used a trench box to protect the employees working in the trench, and the employees were also shoring the trench. When the compliance officer suggested that it would be more effective to use the trench box than to shore, Crawford quickly brought the trench box. These facts indicate a high degree of good faith on Crawford's part.

We find that the gravity of this violation was moderate. Trench cave-ins frequently result in fatalities, and we have therefore normally considered trenching violations to have a high degree of gravity. The frozen soil here, however, increased the stability of the walls. We cannot determine exactly how

long any employee worked in the unshored portion of the trench. It does not appear to have been long, however, and Crawford was about to extend the shoring. On balance, we deem a penalty of $100 to be appropriate.

Accordingly, the judge's decision is reversed. The citation is amended to allege noncompliance with 29 C.F.R. § 1926.652(c); a serious violation of the Act is found and the citation as amended is affirmed. A penalty of $100 is assessed.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: MAR 29 1982

ROWLAND, Chairman, dissenting:

I dissent from the majority's decision to amend the citation. In my view, the parties did not impliedly consent to try an alleged violation of section 1926.652(c). Accordingly, I would affirm Judge Patton, who denied the amendment and vacated the citation.

An amendment of the pleadings under Rule 15(b) may not be based on implied consent unless the parties squarely recognized at trial that they were trying an unpleaded issue. International Harvester Credit Corp. v. East Coast Truck, 547 F.2d 888 (5th Cir. 1977); 3 Moore's Federal Practice ¶15.13[2] at 15-171, 15-172 (1980). See Vicon Corp., 81 OSAHRC 98/C4, 10 BNA OSHC 1153, 1981 CCH OSHD ¶ 25,749 (No. 78-2923, 1981) (concurring opinion), appeal filed, No. 81-2359 (8th Cir. Dec. 10, 1981).

Here, the citation, the complaint and the hearing were directed toward an alleged violation of section 1926.652(b). The Secretary was given full opportunity to amend, and indeed amended the description of the cited condition once before trial; however, the Secretary nevertheless persisted in the section 1926.652(b) charge throughout the hearing. I therefore conclude that the parties did not squarely recognize that an alleged violation of section 1926.652(c) was being tried.

The majority reasons that Crawford elicited testimony on the composition of the soil. However, the fact that Crawford elicited such testimony, and indeed defended on the ground that the soil was not soft as alleged, does not show implied consent. The evidence concerning the nature of the soil was relevant to both sections 1926.652(b) and (c). Consent cannot be implied from the introduction of evidence relevant to both a pleaded and unpleaded charge. International Harvester Credit Corp., supra. See McLean-Behm Steel Erectors Inc. v. OSHRC, 608 F.2d 580 (5th Cir. 1979). Since all of the proof related to the violation

originally charged, I disagree with the majority's conclusion that Crawford impliedly consented to try an alleged violation of the unpleaded standard.

Therefore, I conclude that Judge Patton correctly denied the Secretary's post-trial motion to amend the pleadings. Inasmuch as the record shows that the Secretary did not establish that the soil was soft or unstable, I also conclude that the judge was correct in vacating the citation for section 1926.652(b). Accordingly, I would affirm Judge Patton's decision.

## DECISION AND ORDER

APPEARANCES

Mark D. Katz, Esquire, and Gary A. Boncella, Esquire, Office of the Solicitor, U. S. Department of Labor, Cleveland, Ohio, on behalf of complainant

Roger L. Sabo, Esquire, Columbus, Ohio, on behalf of respondent

## STATEMENT OF THE CASE

PATTON, Judge: The complaint in this case alleged that the respondent violated standard 29 C.F.R. 1926.652(b) of the Occupational Safety and Health Act of 1970 (29 U.S.C. § 651, et seq., 84 Stat. 1590, hereinafter referred to as the Act). The complaint was based upon a citation making similar allegations.

The case was heard on May 21, 1979, in Columbus, Ohio. The complainant and the respondent appeared and presented evidence. There was no motion to intervene. Both parties have submitted briefs.

## LAW AND ISSUES IN THE CASE

It was alleged that a trench was neither properly sloped or braced. The case was tried on the issue of whether a trench was soft or hard soil. Subsequent to the hearing, the complainant, in his post hearing brief, moved to amend the citation and complaint so as to allege a violation of standard 29 C.F.R. 1926.652(c). The complaint alleges that the respondent was guilty of a willful violation. In the event a violation is found, it is necessary to determine whether the violation was willful.

## EVIDENCE AND EVALUATION OF THE CASE

The answer of the respondent admitted that respondent is engaged in the business of installation, maintainance, and repair of sewer lines and water lines, and respondent is engaged in a business affecting interstate commerce within the meaning of section 3(5) of the Act.

It was further admitted that at the time of inspection the respondent was engaged in work on a worksite on State Route 61 North of Hossford Road in Galion, Ohio, on or about February 7, 1979, and at said site, respondent was engaged in the business of excavation, contracting, and installation of a sewer line.

Mr. Paul Thomas Brown, who made the inspection for complainant, testified that respondent was constructing a trench right across the highway, which highway was closed to traffic (Tr. 9). The trench ran east and west across the highway, completely crossing the road. The trench was ten feet, three inches deep, thirty-two feet long, and forty inches wide (Tr. 9-10). There was no support for the walls of the trench, except at the extreme end where there were braces along some pipes (Tr. 9-10). There was an employee working at the bottom of the trench near the middle of it (Tr. 10). The soil was sandy with some veins of clay in the walls. There was a substantial amount of water running into the trench from the top of the ground because some snow was melting at the time. Some water was also oozing into the sides below the top of the ground level (Tr. 10-11). One piece of machinery was operating at the trench and an Insley backhoe was at the west end of the trench (Tr. 11). A pump with a hose was pumping the water out of the trench (Tr. 15). The man in charge of the operation at the site, Mr. Sands, told the compliance officer that the trench had vertical walls without bracing because they did not expect to be in the trench long. He stated he knew it should be shored or braced or some other means of protection (Tr. 15). It was estimated that the

employee would be working in the trench two or three hours (Tr. 15). While the compliance officer was present, they attempted to put two-by-eight feet sheets of plywood in the wooden braces to help support the sides of the trench, but it was wet and slippery, and the employees kept losing them. At the suggestion of the compliance officer, a trench box or trench shield that could be used for the protection of employees was inserted in the trench. It was found to be too wide, and it was necessary to further excavate the trench another two or three inches (Tr. 16-17). The compliance officer testified that the banks could cave in at any time, and that the walls were high over the heads of the employees (Tr. 21).

It was admitted that the top of the soil was blacktop for the road, and that under the blacktop was at least two feet of frost (Tr. 25). There was also some rock and gravel under the pavement (Tr. 25). The frost was far enough down that he was unable to get any of the dirt out (Tr. 29). He could tell it was sand by looking at it and took no tests (Tr. 29-30). He did not witness any falling off of the soil banks and the banks appeared to be staying up very well at that time (Tr. 32).

There was some gravel at the bottom of the trench (Tr. 36). The intent was to fill the trench with gravel to the level where they could get the proper grade to rest the pipe (Tr. 36). The pump ran continuously (Tr. 42).

Mr. Sand, on behalf of the respondent, testified that at the top there were approximately five inches of blacktop and possibly another eight inches of macadam base and then frozen material. The blacktop and frozen material constituted an approximately three-feet depth, then there was dark blue clay (Tr. 50). He stated he did not see any sand (Tr. 50). He defined the soil as hard (Tr. 52). He had thought about using a trench box and had discussed it, but did not use it because he thought the trench was safe (Tr. 53). He was in the trench the day of inspection and helped the employee a couple of times (Tr. 54). Water was

running down the curb line and running down into the trench and also cut into a 12-inch storm sewer, and there was water running out of that (Tr. 56). He had a two-inch pump and pumped it out with a pump (Tr. 56). There was no water coming out of the sides (Tr. 56). It had snowed some, but the sun had come out enough that it had warmed the snow lying on the side of the road, and the snow was melting. It was very chilly (Tr. 56-57). There was no fall off of material anywhere (Tr. 57). He admitted he was pretty familiar with OSHA requirements before the inspection. He admitted that there is a slide effect of clay when it gets wet (Tr. 60).

He testified that the State requires for highway jobs that compaction be 100 percent (Tr. 66). If compaction is not done it is necessary to dig it back up and redo it (Tr. 68). He stated that the frozen ground is like concrete or stone and asphalt also affected compaction (Tr. 68-69). He thought it was safe (Tr. 69). He testified that when it would start to thaw compaction would be affected. It was still, however, frozen (Tr. 70).

Equipment Operator Robert Garverick testified that the digging was in hard blue clay. He stated it would not come out of the bucket without jerking, and that experience has taught when this results, the ground is hard (Tr. 75). The side was not sloped because he did not want to take up more roadway, which would have had to be repaved (Tr. 81).

Mr. Neil Shinaberry, who is a laborer working for respondent, also described the walls as blue clay with gravel at the bottom and confirmed there was blacktop at the top and the soil was frozen about three feet deep.

Consulting Engineer Robert Dunbar testified that the only way to be certain as to composition of the soil is to run a test and to perform calculations (Tr. 91). He considered this trench as stable (Tr. 95-96). He stated frozen ground causes greater stability, and that the freezing of ground is common and accepted practice

for creating additional stability to vertical walls (Tr. 95-97). He stated, however, that it is possible to have hard soil and still have a lack of stability. Looking at Exhibit 1 he found no evidence of water seepage or other type problems coming from the sides of the trench. It appeared to him to be stable (Tr. 100). It is true that moisture content generally reduces the shearing strength (Tr. 102). The backhoe would apply additional force to the wall, but not necessarily create instability (Tr. 103). The backhoe was at the end of the trench, and therefore would have little affect upon the stability of the walls (Tr. 108). He did not feel that water running from the top would have an affect if the ground was frozen at the top (Tr. 109). If the trench had been open for weeks and filled with water, it would affect stability, if only open a day, and the volume of water was small in the bottom of the trench, he would not be concerned about instability (Tr. 110-111). He had heard of trenches caving in in hard or compact soil (Tr. 113). Frost action would act as a cementing agent to take the angle of repose up to 90 degrees (Tr. 113-114). The vertical walls are permitted by OSHA in rock-types such as limestone or shale or in cemented materials, and in his opinion, this would qualify for vertical walls (Tr. 115). If thawing, however, it would make a difference, but so long as frost is not changing or increasing, the stability will be maintained (Tr. 115-116).

Although there is a factual issue between the parties as to the composition of the walls of the trench and whether it was composed of soft or hard soil, the greater weight of the evidence would appear to sustain the position of the respondent that the trench was hard soil. It is not disputed that it was hard at the top with the paving of the street and anywhere from two to three feet of solidly frozen soil. It is not disputed that solidly frozen soil is extremely hard soil. The dispute between the parties is as to the nature of the soil beneath the level of the frozen soil. The complainant described it as sandy soil with some clay, whereas

several witnesses of the respondent described the soil as blue clay, which was hard and compact. In view of the differences between the witnesses as to composition of the soil, the scales are tipped in favor of the respondent by the fact that the bucket would jerk, and the evidence is to the effect that this was always evidence of hard soil.

It will further be noted that the burden of proof is on the complainant to establish the composition of the soil. The compliance officer merely looked at the soil and concluded that it was sandy and unstable. He did not take any samples or perform any tests. He tried to scrap a little off the sides, but in view of the frozen nature of the top of the soil, he was unable to secure any. Therefore, it would appear at best that the complainant has a guess from one of its witnesses as to the nature of the soil with no actual test made and no concrete proof as to the composition of the soil. It cannot be left to mere speculation, and a case is not made out by guessing and speculation. This is particularly true in view of the substantial evidence of the respondent to the effect that the soil from top to bottom was of a hard nature.

The issue therefore arises as to whether the motion to amend so as to allege a violation of the standard dealing with trenches in hard soil should be granted. The evidence introduced would appear to establish that the respondent did not conform to the requirements of the standard dealing with hard soil, anymore than he conformed to the standard dealing with soft soil. It is the position of the respondent, however, that respondent would be prejudiced by the complainant adopting an entirely new theory after all of the evidence is in and after the record is closed.

The complainant seeks to amend on the basis of the liberal provisions for amendment in the United States District Court's Rules of Civil Procedure. The

Rules of the Occupational Safety and Health Review Commission provide that where there is no specific Commission Rule, the Rules of Civil Procedure for the United States District Court shall be applicable. There is no specific rule of the Commission, and therefore it is necessary to look to the Federal Rules of Civil Procedure to determine whether or not the amendment should be granted.

Rule 15(b) of the Rules of Civil Procedure is as follows:

> "Amendments to Conform to the Evidence. When issues not raised by the pleadings are tried by express or implied consent of the parties, they shall be treated in all respects as if they had been raised in the pleadings. Such amendment of the pleadings as may be necessary to cause them to conform to the evidence and to raise these issues may be made upon motion of any party at any time, even after judgment; but failure so to amend does not affect the result of the trial of these issues. If evidence is objected to at the trial on the ground that it is not within the issues made by the pleadings, the court may allow the pleadings to be amended and shall do so freely when the presentation of the merits of the action will be subserved thereby and the objecting party fails to satisfy the court that the admission of such evidence would prejudice him in maintaining his action or defense upon the merits. The court may grant a continuance to enable the objecting party to meet such evidence."

Although the above rule provides for very liberal amendments of pleadings, even after judgment, it will be noted that the first condition for such amendment is as follows:

> "When issues not raised by the pleadings <u>are tried by express or implied consent</u> of the parties, they shall be treated in all respects as if they had been raised in the pleadings. . . ." (Emphasis supplied)

It cannot be said that a trial based upon an allegation that a violation has occurred in hard and compact ground was consented to by the respondent either expressly or by implication. On the contrary, the entire hearing was a contest over whether the soil was soft and unstable, and the respondent's defense and entire position was based on the contention that the soil was of a hard and compact nature. Not even when the evidence developed, as above set forth, and substantial evidence was introduced to the effect that the soil was hard and compact, was any

request made at the hearing for an amendment of the pleadings so as to allege a violation of the standard relating to hard and compact soil.

Although the evidence introduced in the case could certainly be related to a standard relating to hard and compact soil, it was equally related to the issues as alleged in the pleadings and as to whether or not the violation was a violation of the standard relating to soft and unstable soil.

In the trial of the issue as to whether a violation of the standard relating to soft soil had resulted, it was essential that the depth and general size of the trench be established and whether there was any bracing or sloping of the trench be proven. The respondent could not very well object to such evidence as outside of the initial pleadings in the case. The fact that the same evidence could be applied to a different theory and a different standard does not mean that the respondent had waived its position that the case should be tried on the pleadings as alleged. It will be noted that Rule 15(b) concludes with the the statement, "The court may grant a continuance to enable the objecting party to meet such evidence." Such opportunity was denied by complainant waiting until after the hearing was closed to request said amendment.

No reason is given as to why a request to amend was not made before the hearing was closed. None of the provisions of Rule 15(b) allowing for liberal amendment can be applied unless the initial condition is meet and that is that issues not raised by the pleadings are tried by expressed or implied consent. To grant the motion to amend would be to expand Rule 15(b) so as to authorize an amendment, even in those instances in which there is no express or implied consent. This Judge does not have the authority to amend the Rules of Civil Procedure, even though it might be argued that to do so would work justice in this case. Respondent in this case never consented, either expressly or by implication to try the issue of whether there had been a violation by failing to shore in hard and compact soil. In

the case of Croom Construction Co., 77 OSAHRC 33/A2, 5 BNA OSHC 1145, 1977-78 CCH OSHD ¶ 21,628 (No. 12686, 1977), the Review Commission held (5 BNA OSHC 1145, 1146-47):

> "Although this Commission has seen fit at times to invoke Rule 15(b) of the Federal Rules of Civil Procedure, which provides for liberal amendment of pleadings, it has permitted such amendments only when the new issues have been tried by the express or implied consent of the parties and no undue prejudice would result therefrom. See Secretary v. Isaacson Structural Steel Company, 17 OSAHRC 496 [3 OSHC 1203] (1975); Secretary v. Park Construction Company, 17 OSAHRC 343 [3 OSHC 1120] (1975); Secretary v. Brisk Waterproofing Co., Inc., 3 OSAHRC 1132 [1 OSHC 1263] (1973).
>
> * * * *
>
> "Under Rule 15(b), implied consent will only be found when the party against whom the amendment is sought was fairly apprised that the unpleaded charge was in issue Niedland v. United States, 338 F.2d 254, 258 (3rd Cir. 1964); Kuhn v. Civil Aeronautics Board, 183 F.2d 839, 842 (D.C. Dir. 1950). If both parties introduce evidence relevant to the amended charge, or if such evidence is introduced without objection, this may indicate that the parties consented to trial of the issue. Peterson v. Klos, 426 F.2d 199, 202-203 (5th Cir. 1970); Arkla Exploration Co. v. Boren, 411 F.2d 879, 883 (8th Cir. 1969); Niedland v. United States, supra. However, it must appear that the parties understood that such evidence went to the amended charge and was not introduced solely because it was relevant to another issue being tried. Freitag v. The Strand of Atlantic City, 205 F.2d 778, 781 (3rd Cir. 1953); Simms v. Andrews, 118 F.2d 803, 807 (10 Cir. 1941)."

It therefore appears that the motion to amend must be denied, and that the complaint has not been sustained.

## FINDINGS OF FACT

1. Respondent maintained a worksite on State Route 61, North of Hossford Road in Galion, Ohio, and on or about February 7, 1979, was engaged at the worksite in the business of excavation contracting and installation of a sewer line.

2. In engaging in said work, the respondent, on said date, permitted its employees to work in a trench which was 10 feet, 3 inches deep, 32 feet long, and 40 inches wide.

3. The top of the trench was paving for a highway under which was compacted gravel and two to three feet of frozen dirt. Under the frozen area, the sides of the trench were blue clay, which was hard and compact soil.

4. The walls of the trench were vertical.

5. No bracing of the walls of the trench had been done in the area in which the employee of the respondent was working on the day of inspection.

## CONCLUSIONS OF LAW

1. Respondent is engaged in a business affecting interstate commerce and is within the jurisdiction of the Occupational Safety and Health Act.

2. An amendment alleging a different standard and changing the theory on which the case is tried can be granted after the conclusion of the hearing of the case only in the event the parties expressly or by implication consented to the trial of such issues.

3. The parties not having expressly or by implication consented to the trial of the issues raised by the amendment, the request to amend should be denied.

4. The complainant has not established that the employees of the respondent were working in soft and unstable soil, and therefore the allegations of violation should be dismissed.

## ORDER

It is therefore ORDERED that:

The motion of complainant to amend the complaint so as to allege a violation of standard 29 C.F.R. 1926.652(c) is denied.

The respondent was not, on February 7, 1979, in violation of standard 29 C.F.R. 1926.652(b).

The complaint and citation are therefore dismissed.

Dated this 12th day of September 1979.

ATLANTA, GEORGIA 30309

# NOTICE OF DECISION

Secretary of Labor v. American Cyanamid Company

OSHRC Docket No. 80-2767

1. Enclosed is a copy of my decision. It will be filed with the Commission on February 25, 1982, and will become the final order of the Commission on March 29, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is March 29, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

## DECISION AND ORDER

APPEARANCES:

Thomas M. Tompkins, Esquire, Office of the Solicitor, U. S. Department of Labor, Dallas, Texas, on behalf of the complainant

George R. Carlton, Jr., Esquire, and James S. Maxwell, Esquire, Dallas, Texas, on behalf of the respondent

Steven Wodka, International Representative, Washington, D. C., on behalf of the union

Gary Weatherbey, International Representative, Belton, Texas, on behalf of the union

EWING, Judge:

## STATEMENT OF THE CASE

This is a proceeding brought before the Occupational Safety and Health Review Commission ("The Commission") pursuant to § 10 of the Occupational Safety and Health Act of 1970 ("The Act"), 29 U.S.C. § 651, et seq., contesting a serious citation issued by complainant to respondent pursuant to § 9 of the Act.

Respondent, American Cyanamid Company, a corporation, is engaged in the business of manufacturing chemicals.

An inspection was conducted at respondent's workplace at 600 North Jones Street in Ft. Worth, Texas, on March 7-11, 1980, and as a result, a serious and a nonserious citation were issued on April 14, 1980. The nonserious citation was deleted and the serious citation was amended.[1/] The serious citation, as amended, alleges a violation of § 5(a)(1) of the Act and, in the alternative, a violation of § 5(a)(2) of the Act in that respondent failed to comply with safety standard at 29 C.F.R. § 1910.134(a)(2).[2/]

---

1/ The nonserious citation alleging a violation of 29 C.F.R. § 1910.134(a)(2) under two items, was deleted on May 5, 1980.

The serious citation originally alleged a three item violation of § 5(a)(1) of the Act. On May 5, 1980, items 1b and 1c were deleted and in the alternative, a violation of 29 C.F.R. § 1910.134(a)(2) was alleged.

2/ Section 5(a) Each employer-

(1) Shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

Respondent filed a timely notice of contest.

An answer to the citation was filed and later a complaint was filed.

A hearing was held in this matter on November 17, 1980, and December 17, 1980, in Dallas, Texas.

The O.C.A.W.I.U. and its Local Union 4-208, authorized bargaining agent for affected employees, were admitted to party status.

The respondent elected to file a post-hearing brief.

## JURISDICTION

The jurisdictional allegations set out in Part II of the Secretary's complaint were not denied by respondent in any answer filed subsequent thereto.

The respondent maintained a corporate office in the State of New Jersey (address of citation). Respondent owned plants in states in the United States other than Texas (Tr. 322-323).

## ISSUES

The issues are:

1. Whether § 5(a)(1) of the Act is applicable to the facts of this case.

---

2/ continued

§ 1910.134 Respiratory protection.

(a) Permissible practice.

* * *

(2) Respirators shall be provided by the employer when such equipment is necessary to protect the health of the employee. The employer shall provide the respirators which are applicable and suitable for the purpose intended. The employer shall be responsible for the establishment and maintenance of a respiratory protective program which shall include the requirements outlined in paragraph (b) of this section.

2. If so, whether the respondent was in serious violation of § 5(a)(1) of the Act.

3. Whether the respondent was in serious violation of 29 C.F.R. § 1910.134(a)(2).

4. Appropriate penalty for any violation found.

## GENERAL DUTY CLAUSE
## § 5(a)(1), ITEM 1 OF AMENDED CITATION

The allegations in support of the alleged § 5(a)(1) violation are:

> In areas where employees may be exposed to excess concentrations of oxide of nitrogen, emergency and escape type respirators were not provided and signs warning of the possible presence of oxide of nitrogen were not posted in the wet end, cobalt fines digestion process xerogel. Also information as to the hazards of oxides of nitrogen was not kept on file and made accessible to employees. Employees were not adequately informed of hazards, exposure symptoms and emergency procedures associated with working in areas where exposure to oxides of nitrogen may occur such as in and around the xerogel wet end area.

If for any reason the above alleged violation does not apply, the following is cited in the alternative.

## 29 C.F.R. § 1910.134(a)(2), ITEM 1 (ALTERNATIVE)

The allegations in support of the alleged violation of § 1910.132(a)(2) are: "Xerogel wet end, cobalt fines digestion process; emergency and escape respirators were not provided and maintained in the area."

## SUMMARY OF THE FACTS

Compliance Officer Henry R. Slagle testified on behalf of complainant. He had been an OSHA compliance officer for five years. He had conducted about 400 inspections as compliance officer, about 40 of which were health inspections (Tr. 10).

He worked for the State of Texas Health Department as a safety engineer from 1970 to 1975, where he dealt with the OSHA 1910 Standards, which were adopted by Texas in 1973 (Tr. 10). He attended all of the basic training courses offered by the OSHA institute (Tr. 12). He holds a Bachelor's Degree in Mechanical Engineering and a Master's Degree in Nuclear Engineering (Tr. 12). He took the normal college level chemistry and bio-chemistry courses (Tr. 12-13).

On March 7-11, 1980, Mr. Slagle conducted an inspection of respondent's workplace at Ft. Worth, Texas (Tr. 13, 17, 19).

He indicated the inspection was in response to a complaint that respondent's employees were exposed to Nitric Acid fumes in the Xero Gel area (Tr. 14-19) and no suitable respirators were available to protect them from the fumes (Tr. 20).

Mr. Slagle testified he (Tr.20-21), interviewed employees working in the Xero Gel area (Tr. 34, 49, 40, 41, 47) and questioned management concerning the operations in that area (Tr. 55, 58-59, 60, 108, 119-121).

He indicated respondent produced Cobalt Nitrate (Tr. 20-21) in a huge open-spaced building (Tr. 51) at its workplace (Tr. 19-20) in the Xero Gel area (Tr. 19).

He testified the Cobalt metal dissolver was a tank about seven feet in diameter and seven feet deep with a flap-type hinged lid, on top (Tr. 150-151). The tank is referred to as the "Cooker" or "Cobalt Tank" (Tr. 180, 345-346).

The cooker had a vent that removed fumes and gases off the top of the material in the tank and vented them out of the building (Tr. 33-34). The top of the cooker extended about eight inches above the surface of a work floor. (Tr. 21).

The cooker was located on the south end of a row of tanks (Tr. 155; Exh. R-3) and that an operator's desk and control panel were located about 10 to 15 feet south

of the cooker (Tr. 149). The operator faced the cooker while working at his desk (Tr. 154; Exh. R-3).

He indicated that there is only one person on duty for each shift; this operator was responsible for the operations in the Xero Gel area (Tr. 157). Materials other than Cobalt Nitrate are generated in the area (Tr. 22).

Mr. Slagle testified that Cobalt Nitrate was produced by reacting a Batch Formula (Exh. C-1) of water and 551 pounds of Cobalt fines (ground Cobalt). It took about six hours for the formula to react (Tr. 26-30). This was not a day-to-day process. The cooker may be used two or three days in a row, then left idle for several days (Tr. 22).

Mr. Slagle testified that the reaction between Nitric Acid and Cobalt causes what is termed an "exothermic reaction," which means considerable heat is liberated from the reaction itself (Tr. 30).

He testified he arrived at a balancing formula (Tr. 31-33, 47-49; Exh. C-2) which shows that when the materials in the Batch Formula (exh. C-1) are reacted, there would be a yield of three parts of Cobalt Nitrate, plus two parts of oxides of Nitrogen, plus four parts of water, plus the heat of the reaction (Tr. 32). Oxides of Nitrogen is a combination of Nitric Oxide and Nitrogen Dioxide (Tr. 33.).

He indicated the chemical symbol for Nitric Oxide is NO and that for Nitrogen Dioxide is $NO_2$ (Tr. 33).

Mr. Slagle indicated that Nitrogen Dioxide is one of the materials listed in Table Z-1 of 29 C.F.R. § 1910.1000. It has a ceiling value of five parts per million (Tr. 46-47).

Nitric Oxide is listed in Table Z-1, and it has a TWA limits of 25 parts per million.

The cooker operators told Slagle that they had seen the cooker boil over one out of every 10 to 12 times it was operated (Tr. 39) and that a lot of liquid would boil out of the tank (Tr. 40-41, 47), and a lot of brownish-yellow smoke was always present when the boilover occurred (Tr. 41, 47).

Mr. Slagle had never seen the cooker process in operation (Tr. 34, 107).

He did not take any air sampling in the cooker area to determine exposure levels of oxides of Nitrogen Tr. 34, 107).

He was of the opinion that the boiled out material contained oxides of Nitrogen; he opined the generated oxides of Nitrogen are released through the surfacing bubbles (Tr. 42), and "that any liquid that would boil out would have this gas entrained in it in some volume" (Tr. 42-43, 49-50), and when the liquid spilled over it would have bubbles of Nitric Oxide and Nitrogen Dioxide in it and when it spread out, these gases would evolve in the atomosphere (Tr. 42).

He indicated that Nitrogen Dioxide vapors are relatively easy to detect because they are brown or brownish-yellow in color and they look like brown smoke (Tr. 38).

Mr. Slagle indicated that Nitric Acid molecules in gas form are basically colorless, but when they hit the free air, they immediately converts to Nitric Oxide and Nitrogen Dioxide (Tr. 38). That when these gases form in the free air after a boilover, there is danger of employee overexposure (Tr. 38).

Mr. Slagle indicated that a prior ambient air test made in 1977 by OSHA (Tr. 54-55) in the cooker area, in a normal non-boilover run, showed the level of Nitric Acid fumes was below the permissible limits or basically non-existent (Tr. 38-39).

He indicated the only time the employees in the cooker area need to wear appropriate self-contained respirators to protect them from overexposure to Nitrogen Oxides was when a boilover occurred (Tr. 38-39).

He testified that the cooker operators he interviewed indicated that when a cooker boilover occurred, they were required to turn off the steam, stand by and run a water hose on the cooker to cool it down (Tr. 59, 144, 152-153).

Mr. Slagle indicated the total digestion of 550 pounds of Cobalt over a 6-hour period would generate 1880 cubic feet of oxides of Nitrogen (Tr. 48). He calculated the average per minute generation was 5.22 cubic feet (Tr. 49).

He testified that if only a cubic foot of Nitrogen Oxide were to be released in a 20 x 30 x 8 foot space, immediately the exposure level would be about 200 parts per million (Tr. 47-48, 52).

He indicated oxides of Nitrogen that are liberated would have a tendency to settle toward the floor, since it is slightly heavier than air (Tr. 53).

Mr. Slagle indicated he made a determination that the employee's exposure to Nitrogen Dioxide in a boilover situation could easily exceed 5 parts per million (Tr. 46-47).

He indicated that oxides of Nitrogen concentrations of 100 to 150 ppm are dangerous for short exposure of 30 to 60 minutes (Exh. C-3; Tr. 74).

Mr. Slagle indicated that an employee can inhale a lethal amount of oxides of Nitrogen in a short period of time without any immediate reaction (Tr.33, 36, 65). The severe symptoms or death occurs 8 to 24 hours later (Tr. 33-36, 65; Exh. C-3).

He testified oxides of Nitrogen do not have adequate warning signs or produce adequate respiratory reactions when initially inhaled, to apprise an employee of its concentration and his exposure (Tr. 33, 36, 65).

He indicated that there were no warning signs posted in the cooker area notifying employees of the dangers of oxides of Nitrogen (Tr. 37-38).

Mr. Slagle testified that no respirators suitable for emergency employee protection against oxides of Nitrogen were provided in the cooker building (Tr. 57, 58, 59).

He indicated respondent had suitable emergency respirators stored in the maintenance shop, two buildings away, several hundred feet from the Cooker area (Tr. 57-60).

He was of the opinion that respirators were needed in the cooker area for employees to use to either work in or for escape when a boilover occurs (Tr. 53).

He was of the definite opinion that a potential for employee overexposure to oxides of Nitrogen existed when a boilover occurs (Tr. 53-54).

He testified that § 1910.134(a)(2) does not indicate the employee should know what he is exposed to, because the employer is supposed to take care of telling the employee when to wear it and when not to wear it (Tr. 37).

He testified that due to the lack of warning signs and lack of knowledge on the part of the employees, he felt that § 1910.134(a)(2) was not completely adequate to relay the significance of the severity of the situation (Tr. 37).

Mr. Slagle was of the opinion that respondent was in violation of section 5(a)(1) of the Act for failure to provide emergency escape-type respirators and post warning signs and to have on file and accessible to the employees information apprising them of the hazards of oxides of Nitrogen (Tr. 37-38).

He was also of the opinion that respondent was in noncompliance with § 1910.134(a)(2) for its failure to provide appropriate respirators for employees use for either escape or to work in the area when a boilover occurred (Tr. 53-54).

Mr. Slagle testified only one employee per shift would be exposed to the hazard (Tr. 76).

The respondent had a respirator program (Exhs. C-4, C-5) which it did not follow or enforce (Tr. 76-85).

He indicated respondent had knowledgeable chemists on its staff at the workplace who were aware that oxides of Nitrogen did exist in the cooker process (Tr. 84), and respondent's own safety program recognized that boilover occurred (Tr. 84; Exh. C-5, page 3).

Mr. Slagle indicated respondent had tried to correct the boilovers by installing an orifice in the acid line to control the flow of acid into the cookers (Tr. 108).

He indicated that an on-the-spot air sampling while a boilover was in progess would establish what the levels of oxides of Nitrogen really were (Tr. 109-110), and would be more reliable than the theoretical chemical calculations he made (Tr. 110-111).

He indicated that both items of the alleged violations in the contested citation are based on the same set of facts (Tr. 104-105).

Mr. Slagle suggested that an appropriate respirator should be located about 20 feet away from the cooker tank, near the stairs southwest of the operator's desk (Tr. 152; see Exh. R-3).

Joe Zbieronek was called as a witness by complainant. He had been employed by respondent at the inspection site for about 11 years (Tr. 162).

In March of 1980, he worked in the Xero Gel area, where three different processes were run (Tr. 163).

He testified he had run more than 100 batches of Cobalt Nitrate (Tr. 164).

The formula most regularly used is the formula set out in complainant's Exhibit 1 (Tr. 167).

He testified a boilover will occur in less than five minutes (Tr. 168). The last boilover he had was on July 4 (year not stated), which occurred at the end of a three hour input of acid (Tr. 169). He hosed the tank down with water (Tr. 169).

He indicated he had three or four boilovers and had seen 10 to 12 boilovers while working for respondent. (Tr. 169).

He testified he tried to prevent boilovers by having the water hose running and ready to wet the tank down when it starts (Tr. 170).

He indicated liquid and orange smoke comes out of the tank when a boilover occurs (Tr. 170) and the liquid drops to the floor below (Tr. 170).

He testified that in April or May, 1980, the respondent instructed the employees to get out of the area when a boilover occurred (Tr. 171). Prior to this time, the operators were required to cool down the tank with a hose and clean up the spill (Tr. 171-172).

He indicated there were no remote controls used to shut the tank down when it boiled over (Tr. 172).

He indicated no respirators were provided in the cooker area to use for fumes (Tr. 173).

He testified he was not told by respondent of the possible hazards of breathing oxides of Nitrogen (Tr. 174). No study material on oxides of Nitrogen were furnished employees by respondent (Tr. 174).

He indicated that before March of 1980, he was not told to stay and hose the tank down when a boilover occurred, but he was trained to do that (Tr. 179-180).

He testified a boilover was rare before they started using Cobalt fines in January, 1980 (Tr. 183, 188-189).

Mrs. Sharon Itaya, a qualified physician with Board Certification in Internal Medicine, was called to testify as a witness by the authorized employee representative with party status.

She indicated nitrous oxide fumes inhaled by a person in sufficient volume is a serious health hazard and it can cause death or serious physical injury (Tr. 193, 198).

She testified that in July, 1980, she interviewed six workers that had formerly worked at respondent's Ft. Worth, Texas, plant for the purpose of doing health studies on them (Tr. 202). Two of these workers had a history of being exposed to nitrous oxide fumes and had suffered health effects from such exposure (Tr. 202-203). The medical records of all six employees interviewed had diagnosis of chronic bronchitis and respiratory problems that their physicians felt were the result of chemical exposures of various sorts (Tr. 203, 211-212).

Dr. Itaya opined that there had been instances of employee overexposure to nitrous oxide fumes in the past at the cited workplace (Tr. 212).

The doctor indicated the latest instance of overexposure to nitrous oxide fumes at the respondent's workplace was in September, 1978 (Tr. 206-210).

Jon Villaume was called as a witness for respondent. He holds a B. S. degree in Chemistry and a Ph.D. in Organic Chemistry (Tr. 230-233).

He indicated that in May of 1980 (Tr. 233-243-244), he and respondent's manager of Corporate Industrial Hygiene visited the cited facility and reviewed the process of cooking Cobalt, the physical layout and the escape areas in the building (Tr. 233).

He testified the cooker area is relatively open; there are at least two means of escape from the area. The distance from the Cooker to an outside door is no more than 50 to 100 feet (Tr. 234).

He indicated they considered installing an escape respirator in the cooker area and rejected it because there would be a time delay in actually putting on the respirator, this would require an employee to make a decision and he concluded an employee's natural decision would be to leave the area (Tr. 234-235). Also, an employee could possibly get exposed while trying to put on a respirator (Tr. 264-265).

He testified it was concluded that the most appropriate procedure, should there be a boilover, would be for the employees to immediately leave the area (Tr. 234).

He was of the opinion that the concentration of oxides of Nitrogen would not reach too high a level in a boilover situation (Tr. 235).

He testified that by comparing the Batch Formula (Exh. C-1) and Mr. Slagle's balancing equation (Exh. C-2), he could not come up with any kind of reasonable determination of what the parts per million of oxides of Nitrogen would be in the air around the cooker (Tr. 236, 244-245). You do not have an equilibrium situation. There is constant exhaust ventilation. The exhaust ventilation over the cooker draws off air and oxides of Nitrogen that are formed (Tr. 237), there are also room exhaust fans.

He indicated that if the acid used in the formula was a 100 percent acid, the gas formed would be all $NO_2$ (Nitrogen Dioxide). Whereas, if a diluted acid was used, the reaction would be more vigorous and would form some NO (Nitric Oxide), which in the presence of air converts to $NO_2$ (Nitrogen Dioxide) (Tr. 237-238).

He indicated the formula was written general enough to include 100 percent acid (Tr. 238).

Doctor Villaume testified that the only way to determine the oxides of Nitrogen parts per million in the air in the cooker area is to run air sample tests (Tr. 239). He recommended in May, 1980, that samplings be done in a boilover since none had been done in the past (Tr. 242-243), to make sure that area was safe.

He testified steam is blanketed around the cooker tank, not injected into it (Tr. 248). Steam is a source of heat to start the reaction (Tr. 248). The reaction is caused by mixing Cobalt with Nitric Acid (Tr. 248).

Dr. Villaume indicated that when the material overflows and hits the floor, it will not continue to react because the Cobalt is in the bottom part of the Cooker (Tr. 249), but steam and any oxides of Nitrogen already generated would come off along with brown smoke (Tr. 250-251, 262).

Whether you get NO (Nitric Oxide) or whether you get $NO_2$ (Nitrogen Dioxide) depends on the concentration of the acid (Tr. 266).

He testified the generation of oxides of Nitrogen is inherent in the Cobalt cooking process (Tr. 242, 267-268) and you cannot rule out the possibility of a boilover emitting into the air oxides of Nitrogen in excess of the ceiling limits without air sampling (Tr. 268).

He testified the NIOSH-OSHA Pocket Guide (Tr. 271; Exh. R-2) to Chemical Hazards states that one can breath up to 50 parts per million of Nitrogen Dioxide and still have the ability to escape from the area and not be hindered in that nor produce any long term effects (Tr. 217, 280; Exh. R-2).

Charles Thomas DeLong was called by respondent as a witness. He had been employed by respondent as an Industrial Hygienist since March, 1979. He holds a B. S. degree in Safety and Health and a M. S. degree in Public Health (Tr. 272).

He visited the cited workplace in about April, 1979, and in November, 1980 (Tr. 274).

He testified that in November, 1980, he conducted air sample testing of a planned boilover of the cooker in question (Tr. 274-275).

A regular experience operator created the boilover (Tr. 274).

He indicated air sample measurements were taken at various places in the cooker area for the presence and concentrations of nitrous oxide plus Nitrogen Dioxide vapors (Tr. 275).

About a minute after the beginning of the boilover, two readings taken between eight and ten feet from the cooker, during the worst stage of the boilover, showed readings of 20 and 30 parts per million of Nitric Oxide (NO) plus Nitrogen Dioxide ($NO_2$) (Tr. 277).

Another reading taken at a point about 20 feet from the cooker, showed 10 parts per million of Nitric Oxide plus Nitrogen Dioxide (Tr. 277).

The next reading was taken down on the first floor level which showed less than one part per million of Nitric Oxide (NO) plus Nitrogen Dioxide ($NO_2$) (Tr. 277).

Between five and ten minutes after the boilover, another reading was taken on the first floor which showed one to two parts per million of Nitric Oxide (NO) plus Nitrogen Dioxide ($NO_2$) (Tr. 277).

He testified a long term tube sampling was done on the operator, which began when the operator started adding acid to the cooker and ended when he left for the

day, this sampling was over a two and a half hour period. When the boilover started the operator adjusted some controls, then walked 50 to 75 feet away on the work floor and later returned to the cooker to clean up. The reading on the operator's sampling was between zero and four parts per million of Nitric Oxide plus Nitrogen Dioxide (Tr. 278-279).

He indicated the boilover lasted about a minute (Tr. 293).

He testified escape respirators are recommended when a certain length of time is needed to get out of an area (Tr. 281-282).

He indicated the needed time is not an element in this case. By merely walking to the exit platform the operator would be out of the exposure area (Tr. 282-284).

He was of the opinion that it would be safer for the employees to leave the cooker area when a boilover starts, rather than take the time to put on a respirator (Tr. 281).

He testified the south stairs are out of the exposure area (Tr. 309). Exhibit R-1 depicts the south stairs (Tr. 287).

Gilbert Loudermilk, respondent's Safety Director of Industrial Hygiene, was called as a witness. He had been safety director for about one and a half years (Tr. 313).

He indicated that boilover problems started in December, 1979, and January of 1980, when chunk Cobalt could not be purchased and the plant began using Cobalt "fines" and powder (Tr. 313).

He characterized the boilovers as being of a few months duration caused by technical problems that were solved at the time of the hearing (Tr. 314).

He indicated he felt respirators were not needed because of the time factor to put them on, an employee could reach safety in less time than it would take to put on a respirator (Tr. 315).

He indicated he instructed the employees to turn on the water, turn off the steam and leave the area (Tr. 315).

The water hose was pointed at the cooker, when turned on the water ran on the outside of the cooker (Tr. 315).

He testified he was present when the test boilover occurred (Tr. 316).

The formula or recipe used in the test boilover was the same as that in complainant's Exhibit No. 1 (Tr. 316).

The boilover lasted a minute or a little over (Tr. 313). No attempt was made to stop the boilover (Tr. 319).

He testified that prior to January of 1980, the employees working on the Cobalt cooker were instructed to get out of the area the moment fumes started in the area or something went wrong (Tr. 321).

He indicated about 50 gallons of material boiled over (Tr. 337).

At the time the boilover began, the operator turned the water hose on; the steam was cut off earlier when the tank reached 150 degrees (Tr. 337-338).

Frank J. Strider, who had been general foreman of respondent's cited plant for 15 years, was called as a witness for respondent (Tr. 341).

He indicated respondent's Exhibit No. 3 depicts the mezzanine floor of the Xero Gel building (Tr. 342).

He kept records of each batch of Cobalt cooked (Tr. 344).

From the first of January, 1980, approximately 165 batches of Cobalt was cooked (Tr. 344).

Since January 1, 1980, 16 boilovers were reported (Tr. 344).

He indicated the safest way is for the men to leave the area when a boilover occurs (Tr. 345).

He was a Cobalt cooker operator for about eight years (Tr. 346). 350).

About half of the 16 boilovers occurred before March 7, 1980 (Tr. 351).

He testified a boilover occurs generally at temperatures of 200 degrees F. or greater (Tr. 352).

He indicated that by using the formula in Exhibit C-1, it would take an hour and a half to reach a boilover point of 200 degrees F. or better (Tr. 353).

He stated a boilover is not a continuous overflowing of material from the tank. It is intermittent. It is short-lived, and it lasts for about two minutes (Tr. 356).

He indicated the only preventative measures to try to stop a boilover are to cut off the steam and put water on the steam jacket to cool it down (Tr. 356). There is nothing else you can do (Tr. 356).

He stated respondent no longer uses the formula set out in Exhibit C-1 (Tr. 363).

He stated he was told that in the planned boilover that the formula in Exhibit C-1 was used, but they kicked up the steam (Tr. 364-365).

He indicated the steam could be cut off at the door (Tr. 366).

It takes only a matter of seconds to leave the area (Tr. 366).

He indicated the water valve and the steam valve are about three feet apart (Tr. 367). The steam valve is controlled by an electrical switch (Tr. 369). You simply flip a switch. It takes a matter of seconds to turn off the steam and turn on the water (Tr. 367).

He stated the tank is a 745 gallon capacity (Tr. 369).

With a 24 inch outage, the tank holds about 460 to 465 gallons (Tr. 369).

He stated there is one Scott Air Pack stored in the shop, a half a city block from the Cobalt cooker (Tr. 370-371), and there are spares in the storeroom next door to the shop (Tr. 372), but the storeroom is kept locked and employees in the Xero Gel building do not have a key to it (Tr. 372-373).

## OPINION

## RESPONDENT'S MOTION TO DISMISS

Respondent made a motion to dismiss the citation and complaint on grounds that the Secretary failed to prove a prima facie case. This motion was made at the close of the Secretary's proof in chief. A ruling was deferred.

The Commission treats a motion to dismiss as a motion for involuntary dismissal under Rule 41(b) of the Federal Rules of Civil Procedure. The Commission has held that a Rule 41(b) motion should be granted only if the evidence preponderates against the Secretary. Williams Enterprises, Inc., 79 OSAHRC 24/B5, 4 BNA OSHC 1663, 1976-77 CCH OSHD ¶ 21,071 (No. 4533, 1976); Harrington Construction Corporation, 77 OSAHRC 7/B3, 4 BNA OSHC 1471, 1976-77 CCH OSHD ¶ 20,913 (No. 9808, 1976).

The compliance officer testified that one batch run would generate 1880 cubic feet of oxides of Nitrogen (Tr. 48), and the average per minute generation was 5.22 cubic feet (Tr. 49). He indicated that if only a cubic foot of oxides of Nitrogen were to be released in a 20 x 30 x 8 foot space, the exposure level would be about 200 parts per million (Tr. 51). The respondent's cooker operators indicated to the compliance officer the cooker boiled over one out of every 10 to 12 times it was

used (Tr. 39) and a lot of brownish-yellow smoke escaped from the cooker (Tr. 40-41, 47) every time it boiled over. The release of brownish-yellow smoke indicated the release of Nitrogen Dioxide (Tr. 38, 42-43, 49-50). The compliance officer indicated he made a determination that the employee's exposure to Nitrogen Dioxide in a boilover situation could easily exceed 5 parts per million (Tr. 46-47) and that the employees were not provided with appropriate respirators in the cooker area. There were no warning signs posted, and no literature available to apprise employees of the dangers of oxides of Nitrogen (Tr. 33, 36-38, 65). The cooker operators were required to stand by and run a water hose on the cooker to cool it down when a boilover started (Tr. 59). The compliance officer indicated that an employee can inhale enough oxides of Nitrogen in a matter of seconds to kill him 16 hours later (Tr. 65, 74). He indicated respondent had chemists on its staff at the workplace who knew oxides of Nitrogen were released when a boilover occurred and the hazard posed thereby (Tr. 76-85)..

I conclude the evidence does not preponderate against the Secretary, therefore, respondent's motion is denied.

## GENERAL DUTY CLAUSE, WHETHER INAPPROPRIATE

Respondent argues that a citation alleging a violation of § 5(a)(1) of the Act is inappropriate when a specific standard applies to the facts. It correctly points out that the alleged violation of § 5(a)(1) of the Act and of § 1910.134(a)(2) are both based on the same set of facts (Tr. 103).

Respondent contends that § 1910.134(a)(2) is applicable to the facts in this case and, therefore, the alleged violation of § 5(a)(1) of the Act is inappropriate.

The Secretary's position is that oxides of Nitrogen do not have adequate warning signs or produce adequate respiratory reactions when initially inhaled, to

apprise an employee of its concentration and his exposure (Tr. 33, 36, 65). That an employee can inhale a lethal amount of oxides of Nitrogen in a short period of time without any immediate reaction (Tr. 33, 36, 65). That § 1910.134(a)(2) does not indicate the employee should know what he is exposed to, because the employer is supposed to take care of telling the employee when to wear a respirator and when not to wear a respirator (Tr. 37). Concentrations of oxides of Nitrogen of 100 to 150 ppm are dangerous for short exposures of 30 to 60 minutes (Tr. 74; Exh. C-3). The severe symptoms or death occurs 8 to 24 hours later (Tr. 33-36, 65; Exh. C-3).

The Secretary contends that due to the lack of warning signs and lack of employee knowledge, § 1910.134(a)(2) was not completely adequate to relay the significance of the severity of the situation (Tr. 37) and, therefore, § 5(a)(1) of the Act is appropriate.

Aside from referring to Table Z-1 of § 1910.1000 to establish the ceiling value of Nitrogen Dioxide, neither party registered any comment on the applicability of the Air Contaminant Standard to the facts in this case.

Under the Act, a citation alleging a violation of § 5(a)(1) is inappropriate when a specific standard applies to the facts. Mississippi Power & Light Co., 79 OSAHRC 109/D2, 7 BNA OSHC 2036, 1980 CCH OSHD ¶ 24,146 (No. 76-2044, 1979); Claude Neon Federal Co., 77 OSAHRC 104/A2, 5 BNA OSHC 1546, 1977-78 CCH OSHD ¶ 21,887 (No. 13810, 1977). A citation under § 5(a)(1) will not be vacated, however, where the hazards presented are interrelated and not entirely covered by any single standard. Crescent Erection Co., 77 OSAHRC 145/B12, 5 BNA OSHC 1711, 1976-77 CCH OSHD ¶ 20,955 (No. 2159, 1977), or where a specific standard does not address the particular hazard for which the employer has been cited. Armstrong Cork Co., 80 OSAHRC 16/D4, 8 BNA OSHC 1070, 1980 CCH OSHD ¶ 24,273 (No.

76-2777, 1980), aff'd No. 80-1580 [9 OSHC 1416] (3d Cir. Nov. 3, 1980; U. S. Pipe & Foundry Co., 78 OSAHRC 8/D6, 6 BNA OSHC 1332, 1978 CCH OSHD ¶ 22,514 (No. 11739, 1978).

Here, the alleged hazard is excess concentrations of oxides of Nitrogen in the cooker work area, when boilovers occur.

The compliance officer was of the opinion that the need for the posting of warning signs and education of cooker operators, apprising them of the hazards of oxides of Nitrogen, was more important than having respirators available (Tr. 36). I disagree. These measures, warning and education, in and of themselves, will not prevent overexposure of employees that are required to work in the cooker area, when boilovers occur. The well warned and educated operator would still be exposed to the same hazard the uninformed operator would be exposed. The warning and education suggested is directed at apprising cooker operators of the results of overexposure, not protection from overexposure, or abatement of the hazard. There is no proof in the record that the cooker operators could be trained, per force of education and warning, to determine the concentration of oxides of Nitrogen present when a boilover occurs, i.e., whether the concentration exceeds or is within permissible limits.

The proof establishes that the presence of oxides of Nitrogen in the free air are always accompanied by a highly visible cloud of brownish-yellow smoke, and are readily detectible. The cooker operators thought the brownish-yellow smoke indicated the presence of Nitric Acid fumes. They were partially right, as indicated below. The NIOSH-OSHA Pocket Guide to Chemical Hazards indicates Nitrogen Dioxide has a pungent acrid odor (Exh. R-2). Cooker operator Zbieronek described the fumes in the work area around the cooker during a boilover: "(I)t gets

kind of potent up there. You can't stand it." The proof establishes that Nitrogen Oxides consist of a combination of Nitric oxide and Nitrogen Dioxide (Tr. 33). That when Nitric Acid is converted to gas form, it is basically colorless, but when it hits the free air, it immediately converts to Nitric Oxide and Nitrogen Dioxide (Tr. 38); Nitrogen Dioxide in the presence of air slowly converts to Nitrogen Dioxide (Tr. 237-238). These gases were a by-product of the Cobalt Nitrate reaction process used by respondent, and they were liberated into the air surrounding the cooker when a boilover occurred. Eight boilovers occurred between January 1, 1980, and March 7, 1980.

Nitrogen Oxides' component gases, i.e., Nitric Oxide and Nitrogen Dioxide, are listed in Table Z-1 of § 1910.1000. The ceiling value of Nitrogen Dioxide is set at 5 parts per million. Nitric Oxide has a TWA limit of 25 parts per million.

In November, 1980, during a planned boilover situation, two air sample tests taken by respondent at between eight and ten feet from the cooker showed a reading of 20 and 30 parts per million of Nitric Oxide plus Nitrogen Dioxide (Tr. 277). These tests were taken about a minute after the boilover started. There is no showing why the concentration of each of these gases was not determined separately. These tests do not facially indicate what percentage of the 20 and 30 parts per million was Nitric Oxide and what percentage was Nitrogen Dioxide. Brownish-yellow smoke was present during the planned boilover (Tr. 297-298) which indicated the presence of Nitrogen Dioxide. It can be concluded that the test readings of 20 and 30 parts per million contained Nitrogen Dioxide. The question is what percentage. The batch formula used to generate Cobalt Nitrate was written general enough to include 100 percent Nitric Acid (Tr. 238; Exh. C-1). Respondent's

witness, Dr. Villaume, indicated that if the acid used in the formula was a 100 percent acid, the gas formed would be all Nitrogen Dioxide (Tr. 237-238). Thus, if the Nitric Acid used in the planned boilover was a 100 percent acid, the 20 and 30 parts per million test reading would be all Nitrogen Dioxide (Tr. 237-238), greatly in excess of the 5 parts per million ceiling limit set by Table Z-1. Moreover, if a diluted Nitric Acid was used in the planned boilover, the gas formed and liberated would be Nitrogen Dioxide with some Nitric Oxide, with the Nitric Oxide slowly converting to Nitrogen Dioxide when it hits the free air (Tr. 237-238), thus the liberated gas formed from either a 100 percent or diluted concentration of Nitric Acid, the final results is all Nitrogen Dioxide gas. A boilover lasts for about two minutes (Tr. 356). I find from the compliance officer's testimony, the air sample tests, and from the record as a whole, that from January 1, 1980, to the date of the inspection, the cooker operators were exposed to concentrations of Nitrogen Dioxide substantially in excess of 5 ppm on the eight occasions when they were required to work around the cooker during boilovers.

The proof fails to establish that the operators were exposed to excess concentrations of Nitric Oxide on these occasions.

As indicated earlier, the hazard alleged is the presence of excess concentrations of oxides of Nitrogen when a boilover occurs. The proof establishes that excess concentrations of Nitrogen Dioxide were present when a cooker boilover occurred. Thus, there is only one hazard involved. This hazard is entirely covered by a single standard, § 1910.1000. Moreover, the protective measures that the citation alleges the respondent failed to use — emergency and escape respirators, signs and literature warning employees of the presence and dangers of oxides of Nitrogen — come within the perimeter of the provisions of paragraph (c) of § 1910.1000.

The Air Contaminants Standard at 29 C.F.R. § 1910.1000 in pertinent part provides:

> "An employee's exposure to any material listed in Table Z-1. . .of this section shall be limited in accordance with the requirements of the following paragraph of this section.
>
> (a) Table Z-1:
>
> (1) Material with names preceded by 'C' - ceiling values. . .
>
> (2) Other materials - 8-hour time weighted averages. . .
>
> "(e) To achieve compliance with paragraph (a) through (d) of this section, administrative or engineering controls must first be determined and implemented whenever feasible. When such controls are not feasible to achieve full compliance, protective equipment or any other protective measures shall be used to keep the exposure of employees to air contaminants within the limits prescribed in this section. Any equipment and/or technical measures used for this purpose must be approved for each particular use by a competent industrial hygienist or other technically qualified person. Whenever respirators are used, their use shall comply with § 1910.134." (Emphasis supplied).

Although oxides of nitrogen are not listed in the Air Contaminant Standard tables as an entity, its two component gases are.

The compliance officer testified that respondent's providing a respirator in the cooker area for employee use to either work in or for escape when a boilover occurred (Tr. 53-54), the posting of signs and providing literature warning employees of the dangers of oxides of Nitrogen, would be appropriate protective measures (Tr. 37-38).

It is concluded that a specific standard, § 1910.1000, does address the particular hazard for which the respondent has been cited, and it also addresses the protective measures respondent is charged with failing to use, therefore, item 1 of serious citation 1 alleging a violation of § 5(a)(1) of the Act, is inappropriate and is vacated.

## AMENDMENT TO CONFORM TO THE EVIDENCE

The Secretary's proof was directed at respondent's alleged failure to use protective measures to keep employees from being overexposed to oxides of Nitrogen Oxides. The issue of hazard abatement per se was not litigated. The Secretary introduced no proof on hazard abatement by use of engineering or administrative controls or the feasibility of such controls. The language of § 1910.1000(e) indicates the protective measures the Secretary sought to have used in this case are something other than administrative controls.

The Secretary has not moved for a F.R.C.P. 15(b) amendment to add in the alternative, or otherwise, an allegation of respondent's violation of § 1910.1000. I feel it would be prejudicial to the respondent for the writer to order such an amendment.

I am aware that in the ordinary case where a motion for a Rule 15(b) amendment has been made, the Commission has held:

> "Amendments of pleadings pursuant to Rule 15(b) of the Federal Rules of Civil Procedure is required when an unpleaded charge has been tried with the express or implied consent of the parties. Southwestern Bell Telephone Co., 78 OSAHRC 100/D8, 6 BNA OSHC 2130, 1978 CCH OSHD ¶ 23,187 (No. 14761, 1978). When a party opposing amendment introduces evidence relevant to an unpleaded charge or fails to object to the introduction of such evidence, then that party implicitly consents to try the unpleaded charge. Bill C. Carroll Co., ___ OSAHRC ___, 1 BNA OSHC 1806, 1979 CCH OSHD ¶ ___ (No. 76-2748, 1979). Additionally, if an amendment would charge only the legal theory from that alleged in the pleading, then consent to the amendment will be implied when the party opposing amendment has not objected to the introduction of evidence relevant to the unpleaded charge, provided that it is not prejudiced by the amendment. McLean-Behm Steel Erectors, Inc., 78 OSAHRC 93/A9, 6 BNA OSHC 2081, 1978 CCH OSHD ¶ 23,139 (No. 15582, 1978), rev'd, 608 F.2d 580, No. 79-1073 [7 OSHC 2002] (5th Cir. Dec. 17, 1979)."

I conclude that the threshold issues raised by § 1910.1000 have not been tried by the express or implied consent of the parties. An amendment would be inappropriate.

I have considered Dr. Itaya's testimony. She indicated the latest instances of overexposure to nitrous oxide fumes was in September, 1978 (Tr. 206-210). This was more than six months prior to the issuance of the citation. I conclude that the alleged employee overexposure testified to by Dr. Itaya has no probative value. Her statement that inhalation of excess concentrations of oxides of Nitrogen, can cause serious physical injury, has been considered as probative evidence (Tr. 193).

A conflict exists in the testimony as to whether the cooker operators were required to stand by when a boilover started and manually run a general purpose waterhose on the cooker steam jacket to cool it down and try to stop the boilover. The compliance officer and operator Zbieronek testified the cooker operators were required to stand by and run the hose. Respondent's Safety Director, Loudermilk, testified that prior to January 1980, the cooker operators were told to leave the area the moment a boilover started. Mr. Strider, respondent's foreman, testified it would only take a matter of seconds to turn off the steam and turn on the water, he was very vague on the point of how the operators were to apply water to the steam jacket with the all purpose steam hose.

I believe more weight must be accorded the testimony of the compliance officer and Mr. Zbieronek than that of Mr. Loudermilk and Mr. Strider.

Respondent contends that neither the original citation nor the amended citation were issued with reasonable promptness. The Commission has held that unless the employer establishes prejudice, a citation will not be vacated for the Secretary's alleged failure to issue it with reasonable promptness. Laclede Gas Co., 79 OSAHRC 94/E13, 7 BNA OSHC 1874, 1979 CCH OSHD ¶ 24,007 (No. 76-3241, 1979). This contention of respondent is rejected. I find that respondent has

made no showing that it was prejudiced by the approximate 60-day delay before the amended citation was issued.

Respondent contends § 1910.134(a)(2) is unenforceably vague. This contention is without merit and is rejected. The standard must be considered not only in terms of the standard on its face but also in light of the conduct to which it is applied. ". . .so long as the mandate affords a reasonable warning of the prescribed conduct in light of common understanding and practices, it will pass. . . muster." Ryder Truck Lines v. Brennan, 497 F.2d 230, 233 (5th Cir. 1974).

Section 1910.134(a)(2) is a validly promulgated standard. Deering Milliken, Inc., Unity Plant, 78 OSAHRC 101/A2, 6 BNA OSHC 2143, 1978 CCH OSHD ¶ 23,191 (No. 12597, 1978), aff'd (5th Cir., November 19, 1980, Docket No. 79-1212), 9 BNA OSHC 1001, 1980 CCH OSHD ¶ 24,991.

Respondent also contends that § 1910.132(a) et. seq. was invalidly promulgated. This contention is misplaced. This standard is not involved in this case. This contention is rejected.

Respondent raises affirmative defenses under the United States Constitution in its answer to the citation. These defenses are not mentioned in respondent's brief. The specific defenses are:

1. The Act provides for unreasonable search of respondent's premises in violation of the Fourth Amendment of the U. S. Constitution. The entry and the inspection in this case was made with the consent of respondent.

In Marshall v. Barlow, (U. S. Supreme Court, No. 76-1143, May 23, 1978 (6 BNA OSHC 1571), the Court found no constitutional objections to the Secretary making entry and inspections with the employer's consent, without a warrant.

2. Section 5 of the Act is so vague and ambiguous that no adequate notice of the conduct prohibited is given to respondent, in violation of the due process clause of the Fifth Amendment. The Court in Bethlehem Steel Corporation v. OSAHRC, 607 F.2d 871, held the general duty clause § 5(a)(1) of the Act is not unconstitutional. "The 'recognized hazard' standard, in our view, gives industrial employers fair notice of the conduct they must avoid."

3. That the standards promulgated by the Secretary pursuant to § 6 of the Act violate the due process clause of the Fifth Amendment because they do not convey adequate notice of the conduct prohibited.

4. The Act delegated both legislative and judicial power to the Secretary to set mandatory standards, to find violations and assess arbitrary penalties, unless respondent contests the violation, in violation of Articles 1 and 3 of the Fifth Amendment of the U. S. Constitution.

5. The Secretary is granted unbridled discretion to investigate, judicially find violations and assess penalties therefor, in violations of Article 3 and the due process clause of the Fifth Amendment of the Constitution.

6. The Act has a chilling effect on the right of respondent to seek appellate review because it has no provision for the stay of abatement, the assessment of penalties for non-abatement during the time period of appellate review, and because the penalty assessed may be increased against respondent if it appeals. These shortcomings violate the due process clause of the Fifth Amendment.

7. Respondent is denied the right to confront its accusers in violation of the Sixth Amendment.

8. That § 10 of the Act clothes the Review Commission, an agency of the executive branch of government, with judicial powers in violation of Articles 1 and 3 of the Constitution.

9. Respondent is denied the right to trial by jury in violation of its rights under the Fifth, Sixth and Seventh Amendment and by Articles 1 and 3 of the Constitution.

10. Respondent is not afforded a hearing by any Court, in violation of the Fifth Amendment.

I reject all of respondent's affirmative defenses under the United States Constitution on the ground that neither the Commission nor its Judges have the authority to rule on them. McGowan v. Marshall, 604 F.2d 885 (5th Cir. 1979). The McGowan Court held the Act is a constitutional exercise of the commerce power. See Godwin v. OSAHRC, 540 F.2d 1013 (9th Cir. 1979). "Furthermore, its enforcement provisions do not deprive the right to jury trial provided by the Sixth or Seventh Amendments." (Citations omitted).

In Atlas Roofing Co., Inc., 430 U. S. 442 (1977), "the United States Supreme Court held that the provisions of the Act permitting the Commission to assess civil penalties without the aid of a jury trial are not inconsistent with the Seventh Amendment to the United States Constitution." In footnote 15 of this decision, the Court noted that, even if the penalties at issue had been criminal fines instead of civil fines, "(t)he Sixth Amendment would then govern the employer's right to a jury and under our prior cases, no jury trial would be required. "Muniz v. Hoffman, 422 U. S. 454, 95 S. Ct. 2178, 45 L. Ed. 2d 319 (1975)" 430 U. S. at 460. Accordingly, the respondent's contentions have no merit. The challenge that OSHA is

unconstitutional has been repeatedly rejected. Noblecraft Industries, Inc. v. Secretary of Labor, CA 9, 1980, 614 F. 2d 199 at page 206.

Respondent contends the authorized representative of affected employees and Joe Zbieronek were not entitled to party status. I reject this contention. It has no merit. Mr. Joe Zbieronek was not granted party status.

ALLEGED VIOLATION OF § 1910.134(a)(2)

Respondent concedes that § 1910.134(a)(2) is applicable to the facts of this case. See Respondent's post-hearing brief at page 5. See Todd Shipyard Corporation, 81 OSAHRC 69/A2, 9 BNA OSHC 2031, 1980 CCH OSHD ¶ 25,516 (No. 77-2545, June, 1981).

The compliance officer testified that the only time the employees in the cooker area need to wear appropriate respirators to protect them from over-exposure to Nitrogen Oxides was when a boilover occurred (Tr. 38-39); that such respirators were needed for the operator's use to either work in or for escape purposes in a boilover situation (Tr. 53).

The cooker operators were required to stand by when a boilover occurred and turn off the steam and run a water hose on the cooker steam jacket, to cool it down (Tr. 59, 152-153, 356).

As indicated earlier, 165 batches of Cobalt Nitrate were run during the period from January 1, 1980, and November 18, 1980, and there were 16 boilovers during this period, 8 of which boilovers occurred prior to the inspection in this case. A little more than 9% of the 165 batch runs resulted in boilovers.

The internal temperature of the cooker material was registered on a temperature gauge located on a nearby control panel. The boilovers occurred

generally when the material in the cooker reached a temperature of 200 degrees F. or better (Tr. 353).

The batch formula used specified the temperature is to be maintained at 150 degrees F. during Nitric Acid addition, and at the end of which, it directed the temperature is to be raised to 180 degrees F., by increased volume of steam, and maintained at that level until the reaction was completed. These desired temperature levels were difficult to maintain because the exothermic reaction in the cooker would on occasions cause the temperature of the material to rise rapidly from the desired level to 200 degrees F. or better and result in a boilover.

An operator with the temperature gauge in his sight would be forewarned that a boilover was likely when the temperature began rising rapidly above either the initial 150 degree setting or the 180 degree setting, and he would have time to don an appropriate gas mask and return to cut off the steam and apply water to the cooker steam jacket without overexposure. When the operator is away from his cooker station attending to his other duties and he detects a boilover is occurring, he could don an appropriate respirator kept out of the contaminate area and safely go into the cooker work area, turn off the steam and cool down the steam jacket with a hose without being overexposed.

I have found that concentrations of Nitrogen Dioxide substantially in excess of 5 ppm was present when a boilover occurred prior to the inspection in this case. Respondent contends it would be safer for an operator to leave the area rather than put on a respirator, then leave. I reject this contention. This contention ignores the fact that prior to the inspection, the operators were trained to stand by when a boilover started, turn off the steam, the acid, if still flowing, turn on the water

hose and apply water to the cooker steam jacket, to cool it down. Thus, the cooker operators were required to perform duties within 15 feet of the cooker where excess concentrations of Nitrogen Dioxide gas was present. The respondent did not object to the introduction of this proof. The charge is failure to furnish respirators for both work and escape. Brevity of exposure does not negate the finding of a violation. American Bechtel, Inc., 77 OSAHRC 214/A2, 6 BNA OSHC 1246, 1977-78 CCH OSHD ¶ 22,466 (No. 11340, 1977). Rather, duration of exposure is a factor to be considered in determining the gravity of the violation for the purpose of penalty assessment. Id.

The Secretary has proven a prima facie case of respondent's noncompliance with § 1910.134(a)(2), which respondent has failed to rebut.

SERIOUS V. NONSERIOUS

Serious and nonserious violations are differentiated on the basis of the degree of probable injury. See Standard Glass and Supply Company, 73 OSAHRC 16/F5, 1 BNA OSHC 1223, 1973 CCH OSHD ¶15,689 (No. 585, 1973). Under § 17(k) of the Act, a serious violation exists, "if there is a substantial probability that death or serious physical harm could result" therefrom. "Probability" refers not to the likelihood of an accident, but to the likelihood of serious injury or death if an accident does occur. National Realty & Construction Co., Inc., v. OSHRC, 489 F2d 1257, 1265 N. (D.C. Cir. 1973).

The Commission has recently examined whether there was a substantial probability that death or serious physical harm could result in the context of a respirator protection violation in Anaconda Aluminum Co., 81 OSAHRC 81 OSAHRC 27/A1, 9 BNA OSHC 1460, 1981 CCH OSHD ¶ 25,300 (No. 13102, 1981). There the

Commission held that it had to look to the nature of the hazard against which the standard was intended to protect. The Commisison determined that 29 C.F.R. § 1910.1000, which limits exposure to CTPV, a carcinogen,was intended to protect employees from contracitng a life-threatening disease, and found the violation to be serious.

Here the hazard aginst which the standard was intended to protect its exposure of employees to Nitrogen Dioxide fumes in excess of 5 parts per million.

Here the proof establishes that the maximum concentration of Nitrogen Dioxide the cooker operators would be exposed to would not be in excess of 30 parts per million over a time period of about 2 minutes. The proof in the record establishes that the Immediately Dangerous to Life or Health (IDLH) level of Nitrogen Dioxide is 50 parts per million. This concentration represents a maximum level from which one could escape within 30 minutes without any escape impairing symptoms or any irreversible health effects (Tr. 217, 271, 280; Exh. R-2). I conclude that serious injury or death could not result from an operators exposure to concentrations of Nitrogen Dioxide of 30 parts per million over a period of about 2 minutes. Thus, I find the violation to be nonserious.

## FINDINGS OF FACT

1. Respondent is a corporation that was engaged in the manufacturing of chemicals in its plant in Ft. Worth, Texas (Tr. 13, 17, 19, 21).

2. Respondent maintains plants and offices in states of the United States other than Texas (Tr. 322-323; citation's address). Respondent did not deny the jurisdictional allegations in Part II of the complaint.

3. On March 7-11, 1980, compliance officer Henry R. Slagle conducted a complaint inspection of the Cobalt Nitrate facility of respondent's workplace in Ft. Worth, Texas (Tr. 13-21).

4. Respondent produced Cobalt Nitrate in a tank known as the "Cooker" in its Ft. Worth, Texas, facility (Tr. 20-22, 345-346).

5. Cobalt Nitrate was produced from a formula of water, Nitric Acid and ground Cobalt, placed in the cooker tank (Exh. C-1; Tr. 26-30). The process took about six hours (Tr. 26-30).

6. Oxides of Nitrogen were a by-product of the Cobalt Nitrate reacting process (Exh. C-2; Tr. 32-33).

7. Oxides of Nitrogen are a combination of Nitric Oxide and Nitrogen Dioxide (Tr. 33). The chemical symbol for Nitric Oxide is NO and for Nitrogen Dioxide is $NO_2$ (Tr. 33).

8. The component gases of oxides of Nitrogen are listed in Table Z-1 of 29 C.F.R. § 1910.1000.

9. Nitric Oxide has a TWA of 25 parts per million (Table Z-1 of § 1910.1000).

10. Nitrogen Dioxide has a ceiling value of 5 parts per million (Table Z-1 of § 1910.1000).

11. The reaction between Nitric Acid and Cobalt produced an exothermic reaction (Tr. 30).

12. Cobalt Nitrate was one of three different processes run in the building in which it was located (Tr. 163).

13. There was only one person on duty for each shift to see after the three different processes in the building (Tr. 157).

14. The employee on duty is known as an "operator" or "cooker operator."

15. The Cobalt cooker was located near the south end of a row of tanks (Tr. 149).

16. An elevated work floor extended along the row of tanks; stairs on either end provide access to the work floor (Exh. R-3).

17. The Cobalt cooker operators' work station is at a desk and a control panel board located about 10 to 15 feet south of the cooker (Tr. 149). The desk faces the cooker (Tr. 154).

18. A formula provided the cooker operator specified the temperature levels that were to be maintained in the cooker (Exh. C-1).

19. Steam injected into a jacket around the cooker was used as a source of heat to start the reaction (Tr. 248).

20. The temperature of the material was to be maintained at 150 degrees F. during the addition of acid (Exh. C-1).

21. After acid addition, the temperature was to be raised to and maintained at 180 degrees F. (Exh. C-1).

22. The temperature of the cooker material is shown on a control panel gauge.

23. The heat from the exothermic reaction would on occasions cause the temperature of the material in the cooker to rise to 200 degrees F. or better, expand and boil out (Tr. 30).

24. Boilovers occurred generally when the temperature of the material in the tank rose to 200 degrees F. or better (Tr. 352).

25. Eight cooker boilovers occurred between January 1, 1980, and March 7, 1980 (Tr. 351).

26. During the period from January 1, 1980, to March 7, 1980, the cooker operators were required to stand by when a cooker boilover started, turn off the steam, acid, and run a water hose on the cooker steam jacket to cool it down and try to keep the boilover from continuing (Tr. 59-144, 153, 171-172, 179-180).

27. A boilover is not a continuous overflowing of material from the tank. It is intermittent. The entire series of material overflow lasts for about two minutes (Tr. 356).

28. Oxides of Nitrogen gases are generated in the solution in the tank and are released through surfacing bubbles, and are liberated from the tank through the flap lid into the air around the cooker when it boils over (Tr. 38-42, 250-251, 262).

29. Each time the cooker boiled over, a lot of liquid would spill out and a lot of brownish-yellow smoke would form in the cooker area (Tr. 40-41, 47, 170).

30. Nitrogen Dioxide vapors form a brownish-yellow smoke (Tr. 38).

31. Nitric Acid molecules in gas form are essentially colorless (Tr. 38).

32. When Nitric Acid gas hits the free air, it immediately converts to Nitric Oxide (Tr. 38).

33. Nitric Oxide in the free air converts to Nitrogen Dioxide (Tr. 237-238).

34. The use of a 100% concentration of Nitric Acid in the formula (Exh. C-1) would result in the by-product gas being all Nitrogen Dioxide (¶ 37-238). The formula was written general enough to include 100% Nitric acid (Tr. 238).

35. The use of a diluted concentration of Nitric Acid in the formula (Exh. C-1) would result in the by-product gas being Nitric Oxide and Nitrogen Dioxide; with the Nitric Oxide converting to Nitrogen Dioxide when it hits the free air (Tr. 237-238).

36. Concentrations of Nitrogen Dioxide substantially in excess of the ceiling limit of five parts per million were present in the cooker work area when the boilovers occurred during the period from January 1, 1980, to March 7, 1980.

37. During the period form January 1, 1980, and March 7, 1980, the cooker operators on duty were exposed to concentrations of Nitrogen Dioxide in excess of five parts per million when the cooker boilovers occurred.

38. Respondent failed to provide appropriate respirators in the Cobalt Cooker area for the operators to use to work in and for escape purposes (Tr. 57-60, 173).

39. Respondent failed to post warning signs and have available litature apprising its employees of the hazards of oxides of Nitrogen (Tr. 33, 36-38, 174).

40. The general duty clause, § 5(a)(1), of the Act is not applicable to the facts of this case.

41. There was not a substantial probability that death or serious physical injury could result from respondent's failure to protect its employees from the hazard of breathing Nitrogen Dioxide (Tr. 46-49, 65, 193; Exh. C-3).

42. The respondent knew or, could with the exercise of reasonable diligence, have known of the existence of excess concentrations of Nitrogen Dioxide when the cooker boilovers in question occurred (Tr. 76-85; Exh. C-5, page 3, 108, 234-242, 267-268).

43. The respondent was in noncompliance with 29 C.F.R. § 1910.134(a)(2).

## PENALTY DETERMINATION

Under § 17(j) of the Act, the Commission is required to give "due consideration" to the size of the employer's business, the gravity of the violation,

the good faith of the employer, and the history of previous violations in determining the assessments of an appropriate penalty. The gravity of the offense is the principal factor. These criteria have been duly considered by the undersigned. The respondent has demonstrated good faith efforts to reduce the hazard by installing an orifice in the tank acid line. Only one employee per shift is exposed to the hazard. The gravity of the violation is considered to be in the low range. The proposed penalty of $360.00 for Item 1 (alternate) of amended serious citation 1, § 1910.134(a)(2), on balance, is found to be appropriate. The violation is amended from that of serious to nonserious citation.

## CONCLUSIONS OF LAW

1. Respondent, American Cyanamid Company, is a corporation engaged in a business affecting commerce and has employees within the meaning of § 3(5) of the Act. The Commission has jurisdiction of the parties and the subject matter of this proceeding.

2. Respondent was in nonserious violation of 29 C.F.R. § 1910.134(a)(2).

3. The general duty clause, § 5(a)(1) of the act, is inappropriate under the facts of this case and it is vacated.

## ORDER

Based upon the findings of fact and conclusions of law, it is ORDERED that:

1. Item 1 of amended serious citation no. 1 is VACATED.

2. Item 1 (alternative) of amended serious citation no. 1 is AFFIRMED as a nonserious violation and a penalty of $360.00 is ASSESSED.

3. The cited hazard in Item 1 (alternative) of amended citation no. 1 shall be abated immediately.

Dated this 25th day of February, 1982.

# NOTICE OF DECISION

Secretary v. Moore Petroleum Service, Inc.

OSHRC Docket No. 80-2984

1. Enclosed is a copy of my decision. It will be filed with the Commission on February 25, 1982, and will become the final order of the Commission on March 29, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is March 29, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

APPEARANCES:

Donald Hill, Esquire, Office of the Solicitor, U. S. Department of Labor, Dallas, Texas, on behalf of the complainant.

George Carlton, Esquire, Maxwell, Bennett, Thomas, Carlton and Maxwell, Dallas, Texas, on behalf of respondent.

## DECISION AND ORDER

EWING, Judge:

## STATEMENT OF THE CASE

This is a proceeding brought before the Occupational Safety and Health Review Commission ("The Commission") pursuant to § 10 of the Occupational Safety and Health Act of 1970, 29 U.S.C. § 651 et seq., ("The Act"), contesting a three-item serious citation issued by the Secretary to respondent pursuant to § 9 of the Act.

Respondent, Moore Petroleum Service, Inc., a corporation, is engaged in servicing oil wells in old depleted fields.

An inspection was conducted at respondent's workplace at oil well rig number seven on Cecil Brown Bl Lease, Hastings Field, Friendswood, Texas, on May 6-8, 1980, and as a result, a serious citation was issued to respondent on May 9, 1980, alleging in item one and item two that it violated § 5(a)(1)[1/] of the Act, alleging in item three that it violated § 5(a)(2) of the Act in that it failed to comply with the standard at 29 C.F.R. § 1910.27(d)(5), and by complaint amendment § 1910.27(d)(5) was deleted, and in its stead noncompliance with the standard at 29 C.F.R. § 1910.132(a) was alleged.[2/]

Respondent filed a timely notice of contest. A complaint and answer were filed.

A scheduled hearing was held in this matter on Febuary 25, 1981, in Houston, Texas. No additional persons desired to intervene in this proceeding.

Item one of serious citation one alleges the conditions that brought about the violation of the general duty clause of the Act were:

---

1/

"Sec. 5, (a) Each employer--

(1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;"

2/

"§ 1910.132 General requirements.

"(a) Application. Protective equipment, including personal protective equipment for eyes, face, head, and extremities, protective clothing, respiratory devices, and protective shields and barriers, shall be provided, used, and maintained in a sanitary and reliable condition wherever it is necessary by reason of hazards of processes or environment, chemical hazards, radiological hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact."

"The derrick was improperly guyed and posed the danger of falling. Guy lines on Rig #7 were not secured with clips at the 'dead-man' area; should be installed in accordance with the 'Accident Prevention in Oil Well Servicing Operations' book published by AOSC. Rig #7 on Cecil Brown Lease B1 had clips on guy lines as listed:

(a) NE guy had only one clip on wire rope at base.

(b) NW guy to monkey board had one clip, guy to top of mast ahd (sic) two clips but dead end had loose slack between clips. Turnbuckle for lower guy connected into upper guy lower clip.

(c) SW guy to top of mast had only two clips, but had a turnbuckle fastened between clips. The turnbuckle other end had guy to monkey board fastened with only two clips.

(d) SE guy had only two clips."

A penalty of $720 was proposed.

Item two of serious citation one alleges the conditions that brought about the violation of the general duty clause of the Act were:

"(a) The hazard of entrapment in the derrick in case of blowout or other emergency posed by only one means of egress (should have had a 'geronimo' line and mechanical slide equipped with a brake ready for immediate use), on Rig #7, Cecil Brown Lease B1 where they were fishing for section tubing that had broken off."

A penalty of $630 was proposed.

Item three of the serious citation, as amended, alleges the conditions that brought about the violation of § 1910.132(a) were:

". . . [T]he employer did not require the use of a ladder safety climbing device to protect against falls in excess of 50 feet while ascending and descending the ladder on the derrick of work over rig #7 on Cecil Brown Lease B1."

A penalty of $630 was proposed.

## JURISDICTION

The parties stipulated the Review Commission has jurisdiction of the parties and the subject matter of this proceeding (Tr. 132, lines 14-16).

## ISSUES

1. Whether respondent was in serious violation of § 5(a)(1) of the Act.

2. Whether respondent was in violation of 29 C.F.R. § 1910.132(a).

3. Appropriate penalty for any violation found.

## SUMMARY OF THE FACTS

At the time of the inspection, the respondent had a contract with Exxon Corporation to service an oil well in an old depleted field (Tr. 21) located in Hastings Field, near Friendswood, Texas (Tr. 27).

Respondent was fishing for tubes lost in the well hole when the inspection started.

The well in question was located on Cecil Brown Bl Lease. The well has no pressure in it (Tr. 42-43).

There was no danger of a fire or a blowup in the field where the well in question was located (Tr. 42-43).

All gas and oil taken from the well in question and other wells in the field had to be artifically lifted (Tr. 42-43).

Respondent had moved its rig number seven to the inspection site either early on the date of inspection or later in the day before the inspection(Tr. 59).

On May 6, 1980, the rig was in operating position.

It is uncontroverted that on the date of inspection, May 6, 1980, the rig was not equipped with a "Geronimo" line and a ladder safety climbing device (Tr. 65, 72-75).

On May 6, 1980, Compliance Officer Cecil A. Martin commenced an inspection of rig number seven at respondent's workplace (Tr. 89-92). During the inspection, Mr. Martin observed six rig supporting guy wires at the ground anchor end. He found that the dead end of the cables looped back to form the anchor eye were secured to

the guy stran with two Crosby clips, in two instances, and with one Crosby clip, in four instances (Ex. P-3, P-10 through P-13; Tr. 96-98, 102, 105-107).

During the inspection, Mr. Martin noticed that a guy wire running off the main rig mast was secured with two Crosby clamps. He also observed that the rig was not provided with a "Geronimo" line and a ladder safety climbing device (Ex. P-4, P-5, P-6, P-7; Tr. 110, 111-112).

He testified that there were several pieces of tubing in the derrick (Ex. P-8, P-9; Tr. 112).

Mr. Martin indicated that the placing of the tubing in the derrick required the presence of a worker on the tubing board to place them in appropriate position (Tr. 113).

Respondent adopted as its safety rules a 1976 edition of a handbook prepared by the Safety Committee of the Association of Oilwell Servicing Contractors (AOSC), entitled "Accident Prevention in Oil Well Servicing Operations" (AOSC Handbook) (Ex. P-2; Tr. 5-7, 134-136). The record is confusing, but the sense of it is, the 1976 handbook was revised in November 1980, after the citation was issued in May of 1980, and it was renamed "Recommended Safe Procedures and Guidelines for Oil and Gas Well Servicing (Ex. P-2; Tr. 7-8).

Respondent's safety director, Ronald Moore, was on the AOSC Safety Committee and helped write the 1976 edition handbook, which respondent adopted as its safety rules, and was using on May 6, 1980 (Tr. 7-8).

The foreword in the AOSC handbook in pertinent part states:

> "The purpose of this handbook is to assist the oilwell servicing industry in the prevention of accidents.
>
> * * *

"The recommendations in this handbook should be used only when applicable and with modifications as necessary due to operating conditions, type of equipment, etc. Nothing herein shall be deemed to constitute the setting up of minimum or maximum standards for oilwell servicing operations or to replace local, state or federal regulations."

ITEM ONE, § 5(a)(1) VIOLATION

The compliance officer testified that he relied on the AOSC handbook in making his determination whether a hazard existed at respondent's workplace (Tr. 99-122).

He indicated the 1976 edition of the AOSC handbook, at page 26 and 27, requires a minimum of three clips on 5/8-inch guy wires; that three Crosby clips give the wire 80 percent load strength at the connection (Ex. P-2; Tr. 103-104).

Mr. Martin stated he would not hazard a guess as to the load strength of the cables he observed with one and two clamps.

The heading of the illustrations Mr. Martin was referring to on page 27 of the AOSC handbook, 1976 edition (Ex. P-2), is captioned: "Efficiency of Connections as Compared to Recommended Load on Wire Rope."

He was of the opinion that respondent's failure to use three Crosby clips on the guy wires in question reduced the weight bearing capacity of wires and created the hazard of "... the derrick falling over due to overload of pipe or strong wind, something like this. They would be putting too much on the rig" (Tr. 105).

On cross-examination Mr. Martin indicated he observed the derrick had four strength guy wires attached to it, to keep the rig from turning over (Tr. 118-120). He indicated all of these strength guy wires had three clips, except one, and it had two clips at the top end (Ex. P-4; Tr. 118-119). He indicated the other guy wires were wind guys (Tr. 117-119).

Mr. Martin, on cross-exxamination, indicated two clips or even one clip may, under certain circumstances, leave the guy wires with sufficient strength to keep the derrick stable (Tr. 122). He indicated he could not say whether the wind lines with one clip and two clips and the strength line with two clips still left the guy lines with sufficient strength for the circumstances of this case (Tr. 123).

Witness Ronald Moore, respondent's operations and safety director and an experienced oil rig operator (Tr. 3, 7), testified the rig had two different types of guy lines, i.e., load lines and wind lines, and each type served a different function (Tr. 136).

He indicated the foundation and the load lines keep the derrick from blowing over, not the wind lines (Tr. 136-137).

Mr. Moore testified the wind lines take a lot of movement out of the derrick but would not prevent it from falling over (Tr. 137-139).

He was of the opinion the guy wires were safely rigged under the circumstances (Tr. 137-138, 149-151).

## OPINION

The Secretary did not establish the load strength of the 5/8-inch cables used to guy the derrick. Neither did the Secretary establish the necessary load strength that would be exerted on the load guy wires to properly secure the derrick and eliminate any danger of it falling over. Moreover, the Secretary did not show that two clips on the one load guy wire reduced the strength of the guy wire to less than that needed to properly secure the derrick under the circumstances. Similarly, the Secretay failed to show that the wind lines with one and two clips reduced the strength of those lines to less than that needed to sufficiently eliminate the wind movement of the derrick under the circumstances.

The compliance officer, Cecil Martin, testified he had inspected 28 to 30 oil rigs since coming with OSHA and inspected 8 or 10 while working for the State of Texas. It is not shown whether any of these inspections involved oil well rig guy wires. I was not impressed with Mr. Martin's knowledge of oil well rig guy wires. He testified he based his testimony concerning the guy wires on the AOSC handbook, 1976 edition, which is a private advisory standard. There is no proof in the record that the use of less than three Crosby clips on a load or wind guy wire is a recognized hazard in the oil well servicing industry that is causing or likely to cause death or serious physical harm to employees. I conclude that the Secretary failed to qualify Mr. Martin as an expert on oil well rig guy wires, and industry recognition, or that the use of less than three clips is a hazard recognized by the oil well servicing industry.

The Secretary advances the AOSC handbook, 1976 edition, as an independent basis for a violation and as evidence of the "industry recognition" element of a general duty clause violation. This is rejected. The Commission has held that the Secretary cannot make a private advisory standard mandatory by adopting it as one of his own, moreoever, he cannot make it mandatory by declaring it as a minimum level of employer conduct under the general duty clause. Cargill, Inc. (Conrad, Montana), 80 OSAHRC 52/A2, 8 BNA OSHC 1745, 1980 CCH OSHD ¶ 24,516 (Nos. 78-4482 and 78-5229, May 27, 1980). Accordingly, item one of serious citation one for violating section 5(a)(1) of the Act for failure to have three Crosby clips on the rig guy lines and properly rigging the guy lines, is vacated.

ITEM TWO, § 5(a)(1)—"GERONIMO" LINE VIOLATION

The proof establishes that the derrick escape device is designed for employee escape from the derrick tubing board in case of a blowout, fire, explosion or the derrick falling over (Tr. 23, 24, 25, 26).

It was respondent's company policy that every rig be provided with a derrick escape device, i.e., a "Geronimo" line (Tr. 26, 27). It was common practice for respondent to provide the rig with a "Geronimo" line (Tr. 64).

I find the respondent recognized the existence of the hazard of the rig being blown over and the use of "Geronimo" lines as a feasible means of substantially abating this hazard (Tr. 36-41, 47).

The proof establishes the derrick was not equipped with a "Geronimo" line on the date of the inspection (Tr. 65, 72, 75).

Respondent contends that "Geronimo" lines are not necessary if no employee is in or on the derrick (Tr. 41-42, 65).

Mr. Moore indicated the rig number seven crew told him that no employees were in the derrick on the day of the inspection or prior thereto (Tr. 49-50).

Derrick hand, Allen Baldree, testified some of his duties on the rig were on the tubing board. He was asked, and he testified, as follows (Tr. 57):

"Q What exactly does a derrick hand do?

"A He works — normally he works above the ground.

* * *

"Q Above the ground. Doing what kinds of things above the ground?

"A Standing tubing back in the derrick.

"Q Okay. What do you mean by standing tubing back in the derrick?

"A Well, if you were to pull pipe out of a hole you would have to have somebody 55 feet up to lay the pipe back where you can pull another pipe out.

"Q What do you mean by pull the pipe back?

"A Well, when you stand pipe back in the derrick, what you are actually doing is it is sitting on the ground and it's tilted. It is leaning to where it can't fall forward, can't fall to the side and can't fall back."

Mr. Baldree testified that no one was in the derrick on the date of the inspection. He did not indicate whether any employee was in the derrick on the day prior to the inspection (Tr. 77).

There is a conflict between the testimony of Compliance Officer Martin and that of Mr. Moore and Mr. Baldree on the issue of whether an employee of respondent was in the derrick on the day prior to the inspection laying the tubing back that is shown in Secretary's exhibits P-8 and P-9. Mr. Baldree's quoted testimony tends to corroborate the compliance officer's testimony that the presence of a derrick hand on the tubing board is required to stand pipe back in the derrick as is shown in exhibits P-8 and P-9. I believe more weight must be accorded the compliance officer's testimony and exhibits P-8 and P-9 than that of Mr. Moore and Mr. Baldree on this point. I find that one of respondent's employees did work on the rig tubing board at the workplace in question either earlier on the day of inspection or on the previous day.

In order to establish a section 5(a)(1) violation, the Secretary must show that an employer failed to render its workplace free from a hazard that is recognized, the occurrence of an incident was reasonably foreseeable, and the likely consequence in the event of an incident was death or serious physical harm to its employees. Pratt & Whitney Aircraft, Division of United Technologies Corp., 80 OSAHRC 38/A2, 8 BNA OSHC 1329, 1980 CCH OSHD ¶ 24,447 (No. 13591, 1980), aff'd in pertinent part, No. 80-4102 [9 OSHC 1554] (2d Cir. April 20, 1981). The Secretary must also demonstrate that there were feasible means available to abate the hazard. National Realty & Construction Co. v. OSHRC, 489 F.2d 1257 [1 OSHC 1422] (D.C. Cir. 1973).

I conclude the Secretary has established the elements of a general duty clause violation of the Act. Accordingly item two of serious citation one for violation of

section 5(a)(1) of the Act for failing to provide the oil well drilling rig with a "Geronimo" line is affirmed.

## FINDINGS OF FACT

1. Respondent is a corporation that was engaged in servicing old depleted oil and gas wells on May 6-8, 1980 (Tr. 21, 27, 42-43).

2. On May 6-8, 1980, Compliance Officer Cecil Martin conducted an inspection of respondent's oil well rig number seven at its work site in Hastings Field, near Friendswood, Texas (Tr. 27), and as a result issued a serious citation to respondent on May 9, 1980. (See file.)

3. On May 6, 1980, respondent's oil well rig number seven was in operation (Tr. 89-91).

4. Rig number seven was equipped with a tubing board which was attached to the derrick 55 feet above the ground level (Tr. 93-94, 11-12).

5. One of respondent's employees, known as a derrick hand, worked off the derrick tubing board either on the day prior to the inspection or early in the morning of the day of the inspection (Tr. 57, 93, 113).

6. The derrick was not provided with a derrick escape device ("Geronimo" line) on May 6-8, 1980 (Tr. 65, 72, 75, 112).

7. The "Geronimo" line was used by respondent as a means of employee escape from the derrick tubing board in case of the derrick falling over or being blown over (Tr. 23, 26).

8. There was no fire, explosion or blowout hazard existing on May 6-8, 1980, at the rig number seven site (Tr. 42-43).

9. Respondent recognized the hazard of the derrick falling over or being blown over, and the occurrence of such an incident was reasonably foreseeable, and

the likely consequence of such an event would be death or serious physical harm to its employees (Tr. 26, 27).

10. There was a substantial probability that death or serious physical injury would result from respondent's failure to provide a "Geronimo" line as a means of employee escape from the tubing board.

11. It was respondent's company policy that all its derricks be provided with "Geronimo" lines when employees worked on the tubing board (Tr. 64).

## PENALTY DETERMINATION

Under section 17(j) of the Act, the Commission is required to give "due consideration" to the size of the employer's business, the gravity of the violation, the good faith of the employer and the history of previous violations in determining the assessment of an appropriate penalty. The gravity of the offense is the principal factor. These criteria have been duly considered by the undersigned. There is only one derrick hand for each rig. Respondent has had no previous citations that have been affirmed. Respondent has approximately 100 employees. Respondent has made a good faith effort to protect its employees from the cited hazard. The probability of an accident occurring is considered to be in the low range. The proposed penalty of $630 for item number two (§ 5(a)(1)) is excessive. I conclude, on balance, that a penalty of $250 is appropriate for item number two. The penalty is accordingly amended.

## ITEM NUMBER THREE, § 1910.132(a)
## LADDER SAFETY CLIMBING DEVICE

I have found from the compliance officer's testimony and from photographic exhibits P-8 and P-9 that there was tubing standing in the derrick tubing board rack and that this tubing was placed into position by a derrick hand working off the derrick tubing board either on the day of inspection or the previous day.

It is uncontradicted that the derrick ladder was not provided with a safety climbing device

Respondent's operations and safety director indicated respondent recognized that ladder safety climbing devices provided its employees fall protection while climbing the rig and it is a company safety rule that all rigs be equipped with safety climbing devices (Tr. 22, 23).

Mr. Moore indicated that if a derrickman fell from a height of 55 feet while climbing the derrick ladder, death or serious physical harm could result (Tr. 19).

## FINDINGS OF FACT

1. On May 6-8, 1980, the derrick ladder in question was not provided with a ladder safety climbing device.

2. Either on May 5, 1980, or the early part of the day on May 6, 1980, one of respondent's employees used the derrick ladder without the safety climbing device to gain access to the derrick tubing board and perform work there.

3. The respondent knew or, could with the exercise of reasonable diligence, have known of the lack of the ladder safety climbing device on the derrick ladder.

4. There was a substantial probability that death or serious physical injury could result from a fall from the derrick ladder (Tr. 19).

5. The respondent was in noncompliance with 29 C.F.R. § 1910.132(a).

## PENALTY DETERMINATION

The penalty criteria set out under § 17(j) of the Act have been given "due consideration" by the undersigned. The gravity of the offense is the principal factor. Respondent had about 100 employees. There is only one derrick hand on each rig. The gravity of the violation is considered to be in the mid range. The respondent has had no previous citations that were affirmed. Respondent has demonstrated good

faith. The proposed penalty of $630 for item number three (§ 1910.132(a)) is excessive. I conclude, on balance, that a penalty of $300 is appropriate. The proposed penalty is accordingly amended.

## CONCLUSIONS OF LAW

1. Respondent, Moore Petroleum Service, Inc., is a corporation engaged in a business affecting commerce and has employees within the meaning of § 3(5) of the Act. The Commission has jurisdiction of the parties and the subject matter of this proceeding.

2. Respondent was not in violation of the general duty clause, § 5(a)(1) of the Act, under the allegations set out in item number one of serious citation number one.

3. Respondent was in violation of the general duty clause, § 5(a)(1) of the Act, under the allegations set out in item number two of serious citation number one.

4. The respondent was in serious violation of 29 C.F.R. § 1910.132(a) under the allegations set out in item number three of citation number one, as amended by the complaint.

## ORDER

Based upon the findings of fact and conclusions of law, it is ORDERED that:

1. Item number one of serious citation number one is VACATED.

2. Item number two of serious citation number one is AFFIRMED and an amended penalty of $250 is ASSESSED.

3. Item number three, as amended, of serious citation number one is AFFIRMED and an amended penalty of $300 is ASSESSED.

4. The hazards in items number two and number three, as amended, of serious citation number one shall be abated immediately.

Dated this 25th day of February, 1982.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

## NOTICE OF DECISION

Secretary v. Tacoma Boatbuilding Co.
OSHRC Docket No. 81-231

Enclosed is a copy of my decision in the above-entitled case. This decision constitutes my final disposition of the proceeding pursuant to 29 U.S.C. §661(i) and 5 U.S.C. §557. I have this date mailed the original decision together with the Commission's file, transcript of testimony, and all exhibits to Richard Shiffmann, Chief Review Counsel, at the Commission's Office in Washington, D.C.

I am required to advise you as follows:

(1) The decision will be filed with the Commission on February 25, 1982 and will become the final order of the Commission on March 29, 1982 unless a member of the Commission directs that it be reviewed. Parties will not receive any further communications from the Commission unless the decision is directed for review. (See paragraphs 4, 5, and 6 below.)

(2) You may petition for discretionary review of this decision by the Commission. An original and three copies of such a petition must be submitted in accordance with 29 CFR 2200.91. The last day the Commission may consider your petition is March 29, 1982, the final order date. This final order date is set by law and cannot be extended.

(3) Petitions for review should be mailed to:

Richard Shiffmann, Chief Review Counsel
Occupational Safety & Health Review Commission
1825 K Street, N.W.
Washington, D.C. 20006

(4) Should review be ordered, each party will be notified and given opportunity to submit a brief.

(5) Please complete and mail the enclosed postcard, indicating whether you presently intend to seek review of this decision. Your response on the card does not bind you in any way, but assists the Commission in scheduling future workload.

(6) For further details on the review process, see Commission Rules 90, 91, 92, 93, 94, and 95.

DATED: February 5, 1982

## DECISION *

From September 30, 1980 to October 17, 1980, the Secretary's compliance officer inspected the boat yard of Tacoma Boatbuilding Company. Thereafter, T.B.C. received two citations and notices of proposed penalty charging ten health and safety violations of the Act.[1/] T.B.C. has denied the charges but has admitted jurisdiction.[2/]

## FINDINGS OF FACT

At the time of the inspection T.B.C. was in the business of shipbuilding and ship repair at its Tacoma, Washington work site. The inspection here took place aboard the Alaska State Ferry TAKU. The ship was being repaired and remodeled. This involved the cutting out of metal panels. The inspection resulted from a complaint concerning possible asbestos exposure aboard the TAKU. Samples were taken testing noise exposure from grinding and chipping, paint spraying and welding. Tests were also taken for employee exposure to airborne contaminents. The tests indicated that T.B.C.'s employees had been exposed to excessive levels of noise, iron oxide fumes, zinc oxide fumes, lead oxide fumes, and copper fumes.

Two employees exposed to excessive noise levels were not wearing hearing protection devices. However, new employees were given safety indoctrinations and advised of the availability

---

* One of the competing interests here was to complete the decision before the February 1982 retirement of the judge.

of protective equipment including earplugs and earmuffs. They were also told under what circumstances they were to wear this equipment. They were invited to advise T.B.C.'s safety department if they had any questions regarding these matters. From time to time T.B.C. took tests to determine noise volume. They also had a disciplinary system for dealing with employees who repeatedly refused to comply with T.B.C.'s standards for health and safety.

This construction was different from the new construction that was usually done by the employer. T.B.C. did not know what substances would be involved in the renovation. In regard to the airborne contaminants, samples were taken for four men who were cutting painted panels using a burning technique. The smoke was sampled and the contaminants were found.

In regard to the ventilation equipment, it was on order at the time the inspection was initiated and it was delivered during the inspection.

Four employees were not wearing respirators. T.B.C. had a safety policy and a respiratory program. Respirators were available in the tool rooms. Notices were posted throughout the shipyard and in every tool room regarding the wearing of respirators. Employees were instructed at some point in the use of respirators as were the supervisors. Tool room personnel were instructed on the maintenance, repair and fitting of respirators.

## OPINION

The inspection was fair and impartial. The evidence establishing the violative conditions is uncontested. The testimony of the Secretary's industrial hygenists is highly credible. The testimony of T.B.C.'s witness was far less credible. The credibility determination was based on listening to the testimony of the witnesses and judging their demeanor while they testified. The evidence clearly establishes each of the violations as alleged. Except for the violation concerning copper fumes, each of the violations indicated that there was a reasonable probability that serious bodily harm or death could result from the violative conditions. All of the violations were done in the open. Therefore, with the exercise of reasonable diligence, the employer could have known of the existence of the violative conditions. Therefore, each of the items will be affirmed as alleged.

In regard to the noise violations, T.B.C. argues that the employees were breaching company standards by not wearing earplugs or earmuffs. It claims that there was no evidence indicating that it was aware of the violation. However, there is evidence indicating that the violation was done in the open and with reasonable diligence, thus the employer could have and should have been aware of the condition. Therefore, this argument is rejected. The fact that earplugs are available in the tool room does not establish an adequate hearing protection policy. What the policy lacks is enforcement of company rules

by company supervisors. This case again indicates an employer who has purchased the trappings of safety and health experts and equipment but omits to adequately use the equipment or the expertise in fear that it would limit the efficiency of the company's operation. T.B.C. here appears to be attempting to shift the burden of responsibility to the errant employees. The Act places the burden on the employer absent a showing that the employee's conduct limited the employer's ability to recognize the violative conditions or to abate them. That showing was not made here. Consequently, the employer remains responsible.

In regard to the air contaminants, T.B.C. argues surprise and failure of the vendors to supply the ventilation equipment. The surprise concerned the fact that the employer did not know what contaminants were present because the work was new to this shipyard. It's obvious that the employer was adequately staffed to determine this information but failed to do so. It appears that this resulted from the employer's eagerness to expedite the work. As a result, the employees suffered.

Similarly, the ventilation equipment was ordered but not installed before the employees were exposed to the hazards. The employer chose to expose the employees in an effort to expedite the work rather than wait for the equipment. Consequently the employer must be held responsible for the exposure.

The arguments concerning the respirators were similar to the arguments concerning the earplugs and earmuffs. For similar reasons they are rejected.

The monitoring and measurement program conducted by the employer was less than adequate. The employer admits this. Therefore, this item (Citation 1 Item 6) will be affirmed as amended.

## PENALTIES

After considering the evidence presented concerning the size of the employer's business, its lack of previous history of violations, its good faith, and the gravity of the violations, it is concluded that the penalties are excessive.

## ORDER

Items 1, 3, 4, 5, and 6 of Citation 1, as amended, and Item 1 of Citation 2 are AFFIRMED. Item 2 of Citation 1 and Items 2 and 3 of Citation 2 are VACATED. The proposed penalties for Items 2, 6 and 7 of Citation 1 are VACATED. The Following amended penalties are AFFIRMED:

| Violation | Penalty |
|---|---|
| Citation 1 Item 1 | $ 500 |
| Item 3 | 400 |
| Item 4 | 400 |
| Item 5 | 400 |
| Citation 2 Item 1 | 0 |

Total penalties of $1,700 are ASSESSED.

Erwin L. Stuller

ERWIN L. STULLER
Judge

DATED: February 25, 1982

## FOOTNOTES

1/ The violations were alleged to have taken place at the time of the inspection, September 30, 1980 through October 17, 1980. The citations were issued on December 22, 1980. They charge Tacoma failed to comply with safety and health regulations in violation of Section 654(a)(2) of the Occupational Safety and Health Act (29 USC 651 et seq.). Citation 1 charges seven serious violations of the Act. Citation 2 charges three nonserious violations of the Act. However, at the hearing, the citation and complaint were amended, Citation 1 Item 2 and the related proposed penalty were vacated, Citation 1 Item 6 was amended from Serious to Nonserious, and the related proposed penalty of $540 was vacated. In Citation 1 Item 7, subitem 7(a) was amended to read subitem 5(c), subitem 7(b) was amended to read subitem 5(d), subitem 7(c) was amended to read subitem 5(e), and the related proposed penalty for Item 7 was vacated. However, the proposed penalty of $540 for Item 5 remains the same. Items 2 and 3 of Citation 2 were vacated.

The items remaining in issue are Citation 1 Item 1 subitems (a) and (b); Citation 1 Item 3 subitems (a) and (b); Citation 1 Item 4 subitems (a) and (b); Citation 1 Item 5 subitems (a), (b), (c), (d) and (e); and Citation 2 Item 1. A description of the alleged violations remaining in issue, the proposed penalties and the safety standards concerned are as follows:

Citation 1, Item 1(a) (Serious)

> Protection against the effects of noise was not provided for employee(s) exposed to sound levels which exceeded those listed in Table G-16 of subpart G of 29 CFR 1910:
>
> (a) Hearing protection was not being worn by a shipfitter exposed to 6.4 times the permissible noise exposure including noise levels above the maximum 115 dBA limit while chipping and grinding aluminum T-bars in the galley on board the ship.
>
> (b) Hearing protection was not being worn by a shipfitter exposed to 6.4 times the permissible noise exposure including noise levels above the maximum 115 dBA limit while grinding aluminum T-bars in the laundry room aft bulkhead of the main deck on board the ship.

In violation of 29 CFR 1910.95(a)

Section 29 CFR 1910.95(a) provides:

> Protection against the effects of noise exposure shall be provided when the sound levels exceed those shown in Table G-16 when measured on the A scale of a standard sound level meter at slow response. When

noise levels are determined by octave band analysis, the equivalent A-weighted sound level may be determined as follows:

Table G-16--Permissible 'Noise Exposures'

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1-1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 or less | 115 |

Citation 1, Item 1(b) (Serious)

Sound levels exceeded the values in Table G-16 of Subpart G of 29 CFR 1910 and a continuing, effective hearing conservation program was not administered:

(a) For the shipfitter exposed to 6.4 times the permissible noise exposure incluidng noise levels above the maximum 115 dBA limit while chipping and grinding aluminum T-bars in the galley on board the ship.

(b) For the shipfitter exposed to 2.2 times the permissible noise exposure including noise levels above the maximum 115 dBA limit while grinding aluminum T-bars in the laundry room aft bulkhead of the main deck onboard the ship.

In violation of 29 CFR 1910.95(b)(3)

Section 29 CFR 1910.95(b)(3) provides:

(3) In all cases where the sound levels exceed the values shown herein, a continuing, effective hearing conservation program shall be administered.

Penalty Proposed for Item 1: $720

Citation 1, Item 3(a) (Serious)

Employee(s) were exposed to material(s) in excess of the 8-hour time weighted average limit(s) listed for the particular material(s) in Table Z-1 of subpart Z of 29 CFR part 1910:

(a) At Tacoma Boat Yard #4, the welder air arcing painted metal panels for removal from the third deck of the TAKU was exposed to 3.7 times the permissible exposure limit for iron oxide fumes.

(b) At Tacoma Boat Yard #4, the Boilermakers apprentice on fire watch for the welder burning painted metal panels for removal from the third deck stateroom of the TAKU was exposed to 1.8 times the permissible exposure limit for iron oxide fumes.

(c) At the Tacoma Boat Yard #4 aboard the TAKU, the welder burning painted metal bulkhead panels for removal from the third deck stateroom was exposed to 2.5 times the permissible exposure limit for iron oxide fumes.

In violation of 29 CFR 1910.1000(a)(2)

Section 29 CFR 1910.1000(a)(2) provides:

(2) Other materials--8-hour time weighted averages. An employee's exposure to any material in table Z-1, the name of which is not preceded by "C", in any 8-hour work shift of a 40-hour work week, shall not exceed the 8-hour time weighted average given for that material in the table.

| | |
|---|---|
| Iron oxide fume | 10 mg./$M^3$ |

Citation 1, Item 3(b) (Serious)

Feasible administrative or engineering controls were not determined and implemented to reduce employee exposure(s):

(a) At Tacoma Boat Yard #4, the welder air arcing painted metal panels for removal from the third deck of the TAKU was exposed to 3.7 times the permissible exposure limit for iron oxide fumes.

(b) At Tacoma Boat Yard #4, the Boilermakers apprentice on fire watch for the welder burning painted metal panels for removal from the third deck stateroom of the TAKU was exposed to 1.8 times the permissible exposure limit for iron oxide fumes.

(c) At the Tacoma Boat Yard #4 aboard the TAKU, the welder burning painted metal bulkhead panels for removal from the third deck stateroom was exposed to 2.5 times the permissible exposure limit for iron oxide fumes.

In violation of 29 CFR 1910.1000(e)

Penalty Proposed for Item 3: $540

Citation 1, Item 4(a) (Serious)

Employee(s) were exposed to material(s) in excess of the 8-hour time weighted average limit(s) listed for the particular material(s) in Table Z-1 of subpart Z of 29 CFR part 1910:

(a) At Tacoma Boat Yard #4, the welder air arcing painted metal panels for removal from the third deck of the TAKU was exposed to 1.8 times the permissible exposure limit for zinc oxide fumes.

(b) At Tacoma Boat Yard #4 aboard the TAKU, the welder cutting and burning painted metal shower stalls for removal from deck #2 shower room was exposed to 1.1 times the permissible exposure limit for zinc oxide fumes.

In violation of 29 CFR 1910.1000(a)(2)

Section 29 CFR 1910.1000(a)(2) provides:

(2) Other materials--8-hour time weighted averages. An employee's exposure to any material in table Z-1, the name of which is not preceded by "C", in any 8-hour work shift of a 40-hour work week, shall not exceed the 8 hour time weighted average given for that material in the table.

| | |
|---|---|
| Zinc oxide fume | 5 mg./$M^3$ |

Citation 1, Item 4(b) (Serious)

Welding, cutting, or heating involving metal(s) identified below was performed in an enclosed space aboard vessel(s) without either general mechanical or local exhaust ventilation meeting the requirements of paragraph 29 CFR 1915.31(a):

(a) At Tacoma Boat Yard #4, the welder air arcing painted metal panels for removal from the third deck of the TAKU was exposed to 1.8 times the permissible exposure limit for zinc oxide fumes.

(b) At Tacoma Boat Yard #4 aboard the TAKU, the welder cutting and burning painted metal shower stalls for removal from second deck shower room was exposed to 1.1 times the permissible exposure limit for zinc oxide fumes.

In violation of 29 CFR 1915.31(c)(1)

Penalty Proposed for Item 4: $ 540

Citation 1, Item 5(a) (Serious)

Employees were exposed to lead at concentrations greater than fifty micrograms per cubic meter of air (50 mg/M3) averaged over an 8-hour period.

(a) At Tacoma Boat Yard #4, the welder air arcing painted metal panels for removal from the third deck of the TAKU was exposed to 1.4 times the permissible exposure limit for oxide fumes.

(b) At Tacoma Boat Yard #4 aboard the TAKU, the welder cutting and burning painted metal shower stalls for removal from the second deck shower room was exposed to 2.4 times the permissible exposure limit for lead oxide fumes.

(c) At Tacoma Boat Yard #4 aboard the TAKU, the welder burning painted metal bulkhead panels for removal from the third deck stateroom was exposed to 1.4 times the permissible exposure limit for lead oxide fumes.

In violation of 29 1910.1025(c)(1)

29 CFR 1910.1025(c)(1) provides:

(1) The employer shall assure that no employee is exposed to lead at concentrations greater than fifty micrograms per cubic meter of air (50 mg/M3) averaged over an 8-hour period.

Citation 1, Item 5(b) (Serious)

Welding, cutting, or heating involving metal(s) identified below was performed in an enclosed space aboard vessel(s) without local exhaust ventilation in accordance with the requirement of 29 CFR 1915.31(a)

(a) At Tacoma Boat Yard #4, the welder air arcing painted metal panels for removal from the third deck of the TAKU, was exposed to 1.4 times the permissible exposure limit for lead oxide fumes.

(b) At Tacoma Boat Yard #4 aboard the TAKU, the welder cutting and burning painted metal shower stalls for removal from the second deck shower room was exposed to 2.4 times the permissible exposure limit for lead oxide fumes.

(c) At Tacoma Boat Yard #4 aboard the TAKU, the welder burning painted metal bulkhead panels for removal from the third deck stateroom was exposed to 1.4 times the permissible exposure limit for lead oxide fumes.

In violation of 29 CFR 1915.31(c)(2)

Section 29 CFR 1915.31(c)(2) provides:

(2) Welding, cutting or heating in any enclosed spaces aboard the vessel involving the metals specified in this subparagraph shall be performed with local exhaust venitilation in accordance with the requirements of paragraph (a) of this section or employees shall be protected by air line respirators in accordance with the requirement of 1915.82(a).

Citation 1, Item 5(c) (Serious)

Respirators were not provided by the employer when such equipment was necessary to protect the health of the employees.

(a) At Tacoma Boat Yard #4, the welder air arcing painted metal panels for removal from the third deck of the TAKU was exposed to 1.4 times the permissible exposure limit for lead oxide fumes.

(b) At Tacoma Boat Yard #4 aboard the TAKU, the welder cutting and burning painted metal shower stalls for removal from the second deck shower room was exposed to 2.4 times the permissible exposure limit for lead oxide fumes.

(c) At Tacoma Boat Yard #4 aboard the TAKU, the welder burning painted metal bulkhead panels for removal from the third deck stateroom was exposed to 1.4 times the permissible exposure limit for lead oxide fumes.

In violation of 29 CFR 1910.1025(f)(1)

Section 29 CFR 1910.1025(f)(1) provides:

(1) General. Where the use of respirators is required under this section, the employer shall provide, at no cost to the employee, and assure the use of respirators which comply with the requirements of this paragraph.

Citation 1, Item 5(d) (Serious)

The employer did not perform quantitative face fit tests at the time of initial fitting for each employee wearing negative pressure respirators.

(a) At Tacoma Boat Yard #4, the welder air arcing painted metal panels for removal from the third deck of the TAKU was exposed to 1.4 times the permissible exposure limit for lead oxide fumes.

(b) At Tacoma Boat Yard #4 aboard the TAKU, the welder cutting and burning painted metal shower stalls for removal from the second deck shower room was exposed to 2.4 times the permissible exposure limit for lead oxide fumes.

(c) At Tacoma Boat Yard #4 aboard the TAKU, the welder burning painted metal bulkhead panels for removal from the third deck stateroom was exposed to 1.4 times the permissible exposure limit for lead oxide fumes.

In violation of 29 CFR 1910.1025(f)(3)(ii)

Section 29 CFR 1910.1025(f)(3)(ii) provides:

(ii) Employers shall perform quantitative face fit tests at the time of initial fitting and at least semiannually thereafter for each employee wearing negative pressure respirators. The test shall be used to select facepieces that provide the required protection as prescribed in table II.

Citation 1, Item 5(e) (Serious)

The employer did not establish and maintain a respiratory protection program which included the requirements outlined in 1910.134(b) & (d) & (e) & (f).

(a) At Tacoma Boat Yard #4, the welder air arcing painted metal panels for removal from the third deck of the TAKU was exposed to 1.4 times the permissible exposure limit for lead oxide fumes.

(b) At Tacoma Boat Yard #4 aboard the TAKU, the welder cutting and burning painted metal shower stalls for removal from the second deck shower room was exposed to 2.4 times the permissible exposure limit for lead oxide fumes.

(c) At Tacoma Boat Yard #4 aboard the TAKU, the welder burning painted metal bulkhead panels for removal from the third deck stateroom was exposed to 1.4 times the permissible exposure limit for lead oxide fumes.

In violation of 29 CFR 1910.1025(f)(4)(i)

Section 29 CFR 1910.1025(f)(4)(i) provides:

(i) The employer shall institute a respiratory protection program in accordance with 29 CFR 1910.134(b),(d),(e) and (f).

Penalty Proposed for Item 5: $ 540

Citation 1, Item 6 (Non-Serious)

An initial monitoring and measurement program was not undertaken to determine if any employee was exposed to airborne lead in excess of the action level:

(a) At Tacoma Boat Yard #4, the welder air arcing painted metal panels for removal from the third deck of the TAKU was exposed to 1.4 times the permissible exposure limit for lead oxide fumes.

(b) At Tacoma Boat Yard #4 aboard the TAKU, the welder cutting and burning painted metal shower stalls for removal from the second deck shower room was exposed to 2.4 times the permissible exposure limit for lead oxide fumes.

(c) At Tacoma Boat Yard #4 aboard the TAKU, the welder burning painted metal bulkhead panels for removal from the third deck stateroom was exposed to 1.4 times the permissible exposure limit for lead oxide fumes.

In violation of 29 CFR 1910.1025(d)(2)

Section 29 CFR 1910.1025(d)(2) provides:

(2) Initial determination. Each employer who has a workplace or work operation covered by this standard shall determine if any employee may be exposed to lead at or above the action level.

Penalty Proposed for Item 6: None

Citation 2, Item 1 (Non-Serious)

Employee(s) were exposed to material(s) in excess of the 8-hour time weighted average limit(s) listed for the particular material(s) in Table Z-1 of subpart Z of 29 CFR part 1910:

(a) On board the TAKU at Tacoma Boat Yard #4, the welder air arcing painted metal panels for removal from the third deck was exposed to 4.1 times the permissible exposure limit for copper fumes.

(b) Aboard the TAKU at Tacoma Boat Yard #4, the welder cutting and burning painted metal shower stalls for removal from the second deck shower room was exposed to 1.1 times the permissible exposure limit for copper fumes.

(c) On board the TAKU at the Tacoma Boat Yard #4, the Boilermaker apprentice on fire watch for the welder burning painted metal panels for removal from the third deck stateroom was exposed to 2.7 times the permissible exposure limit for copper fumes.

(d) At the Tacoma Boat Yard #4, the welder burning painted metal bulkhead panels for removal from the third deck stateroom was exposed to 2.4 times the permissible exposure limit for copper fumes.

In violation of 29 CFR 1910.1000(a)(2)

Section 29 CFR 1910.1000(a)(2) provides:

(2) Other materials--8-hour time weighted averages. An employee's exposure to any material in table Z-1, the name of which is not preceded by "C:, in any 8-hour work shift of a 40-hour work week, shall not exceed the 8-hour time weighted average given for that material in the table.

Copper fume 0.1 mg./$M^3$

Penalty Proposed for Citation 2, Item 1: None

2/ T.B.C. filed a timely notice of contest. At that point the Commission acquired jurisdiction over the subject matter under Section 659 of the Act. T.B.C. admitted jurisdiction in its answer. It is consequently concluded that T.B.C. is an employer with employees engaged in a business affecting commerce within the meaning of Section 3 of the Act.

APPEARANCES: Saundra Robinson, Esquire, Office of the Solicitor, U. S. Department of Labor, Cleveland, Ohio, on behalf of complainant.

Anthony J. Polito, Esquire, and R. Henry Moore, Esquire, Rose, Schmidt, Dixon, Hasley, Whyte and Hardesty, Pittsburgh, Pennsylvania, on behalf of respondent.

John K. Molovich, Staff Representative, United Steelworkers of America, Pittsburgh, Pennsylvania, on behalf of intervenor.

## DECISION AND ORDER

Burroughs, Judge: Respondent, an employer engaged in the manufacture of steel, contests an alleged willful violation of section 5(a)(1) of the Occupational Safety and Health Act of 1970 ("Act") for failing to remove moisture or water from its tapping pits prior to tapping or pouring of molten metal from its furnaces. The alleged violation results from an explosion occurring at approximately 3:30 a.m. on

April 17, 1979, at the end of a tap of a heat of steel at furnace number eight in the melt shop on the midnight shift.[1/]

Respondent's melt shop contains five 90-ton electric arc furnaces. The furnaces are at ground level, and tapping pits are located underneath the furnaces. The pits are 35 feet deep, 22 feet wide, 24 feet long and constructed of reinforced concrete three to five feet thick. The furnaces are "tapped" at the end of a heat of steel into 90-ton "bottom pour" ladles which are positioned in the tapping pits prior to the tap. The ladle is positioned close to the bottom of the pit. There is approximately two feet of clearance between the sides of the ladle and the pit when the ladle is positioned for a tap. During a tap, the furnace is tilted forward and empties molten metal out of a tap hole, along a "runner" and into the ladle.

On April 16 and 17, 1979, melter Frank Richards was working on furnace numbers six and eight during the 11:00 p.m. to 7:00 a.m. shift (Tr. 194). At approximately 3:30 a.m. on April 17, 1979, at the end of the second tap of a heat of steel on furnace number eight, slag overflowed all sides of the ladle, covered water in the middle of the pit and caused an explosion (Tr. 194, 196, 201). The water formed a puddle two and a half to three feet in diameter and was approximately three inches deep in the center of the uneven bottom of the pit (Tr. 198, 211). The overflow occurred as a result of unusual circumstances, i.e., a fast tap and an unusual slag reaction.

---

1/ The case originally involved three citations issued to respondent on May 8, 1979. Prior to hearing, the parties reached a settlement of all the alleged violations with the exception of item one of the willful citation (designated as citation number two). A stipulation and settlement agreement was filed on October 3, 1979, with regard to the items that had been settled. The terms of the settlement have been incorporated in the order entered in this case.

As a result of the explosion, the third helper on the furnace sustained minor burns on the back of his neck. Prior to going to the plant hospital, he took approximately 30 minutes to complete certain tasks around the furnace. After being treated, he returned to complete his shift. Except for the short period of time he was in the plant hospital for treatment, he missed no time from work (Tr. 54, 194-195, 201-202, 282). No other employees incurred any type of injuries.

Prior to the second tap of the shift for furnace number eight, Richards was aware of water being in the middle of the tapping pit and so informed his crew. While he was aware of the presence of the water, he was of the opinion that the quantity of water present was insufficient for a portable pump to be effective in removing it (Tr. 195, 198, 275-276, 294-295). He did not consider the quantity of water in the pit to be sufficient to present a danger to the employees (Tr. 196, 199).

Prior to April 17, 1979, respondent's procedure for controlling water in the pits involved pumping out all water possible prior to tapping (Tr. 351). This procedure had been followed for several years without incident. Respondent did not tap when there was a substantial amount of water in the pits. Richards testified that when there was a break in a water line or any other incident sufficient to cause a large accumulation of water in the tapping pits, the water would be pumped or the spare furnace started[2/] (Tr. 199, 212, 218). While he did not consider three inches of water in the pit to be a large volume of water, he expressed the opinion that a large volume of water would present a hazard[3/] (Tr. 209, 212). For this reason, any

---

2/ Richards emphasized that a break in a water hose presented a different type of situation that required immediate attention. If a water hose had been broken, he indicated that he would not have tapped the heat (Tr. 199, 200).

3/ According to Richards, six inches of water in the pit would present a hazard during a tap (Tr. 214).

accumulation of water large enough to be pumped was pumped on a priority basis. No more than three inches of water was ever in the pits after pumping (Tr. 197, 294, 316-317, 321-323, 351). Thus, prior to and on April 17, 1979, furnaces were tapped with a limited amount of water in the pits.

Respondent has been charged with a violation of section 5(a)(1)[4/] of the Act. In order to establish a violation of the general duty clause, complainant has the burden of proving that (1) the employer failed to render its workplace free of a hazard which was (2) recognized, and (3) causing or likely to cause death or serious physical harm. National Realty and Construction Company v. OSHRC, 489 F.2d 1257 (D. C. Cir. 1973). The complainant also must show the feasibility and likely utility of a means to eliminate or materially reduce the alleged hazard. Whirlpool Corp., 79 OSAHRC 32/A14, 7 BNA OSHC 1356, 1979 CCH OSHD ¶ 23,552 (No. 9224, 1979), appeal filed, No. 79-1692 (D. C. Cir., July 3, 1979). The phrase "likely to cause" found in section 5(a)(1) refers to the probability that the accident will result in death or serious physical harm and not the probability of an accident occurring. R. L. Sanders Roofing Company, __ OSHRAC __, 7 BNA OSHC 1566, 1979 CCH OSHC ¶ 23,756 (No. 76-2690, 1979), appeal filed, No. 79-2958 (5th Cir., August 15, 1979).

Respondent does not dispute the finding that there was a small amount of water in the pit. While the exact amount of water is unknown, there is no credible evidence to dispute the testimony of Frank Richards that the water in the pit was

---

4/ Section 5(a)(1) provides:

(a) Each employer—
(1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;

of such a small quantity that it could not be removed by a portable pump (Tr. 195, 197-198). While both parties are in agreement that an explosion will occur when molten metal covers water, respondent submits that tapping a furnace with water or dampness, in the limited amounts present on April 17, in a deep, well-constructed tapping pit, was not a hazard recognized by it or the industry.

Complainant argues that "the potential for injury from molten steel dripping into a pit containing moisture or liquid is great, that is, that the hazard is, at the least, likely to cause death or serious physical harm." This sweeping generalization simply bears no relation to the facts of this case. It does not differentiate or recognize that the degree of injury, if any, might depend upon the volume of water in the pit. The argument also fails to recognize that the amount of molten steel to overflow a ladle might also have a bearing on the intensity of any explosion. It further fails to take into account the depth and width of the pit, the type of construction and the fact that the ladle is positioned in the pit prior to any possible danger from an overflow.

The parties agree that an explosion will occur whenever molten metal covers and entraps water. Richards and the members of his crew were aware of the water in the pit prior to the tap. They were also aware of the likely consequences of the molten metal overflowing the ladle and falling into the water in the center of the pit. This conclusion is easily supported by the fact that the employees moved back from the pit when they saw the ladle overflowing[5/] (Tr. 215-216, 282). Thus,

---

5/ The employees were simply following advice given to them by supervisory personnel. Whenever a tap was made with a small amount of water in a pit, respondent's supervisory personnel advised the employees to stand back from the pit or take protective cover in the event the ladle overflowed (Tr. 198, 215-216, 329, 354). Respondent's general supervisor of melting, Victor Alberini, testified that

respondent recognized a hazard since it was aware of the water in the pit and knew an explosion would occur if the ladle overflowed and the molten metal entrapped the water in the pit. However, respondent did not believe that an explosion would ever result in a serious injury. This opinion is supported by the fact that it had never had an employee seriously injured during the tapping process (Tr. 214, 352).

While it is concluded that employees were exposed to a recognized hazard, a determination must be made as to whether the record justifies a conclusion that the hazard was causing or likely to cause them death or serious physical harm. In this regard, the minor burns suffered by the third helper are not determinative of the issue. The existence of an accident, taken by itself, is not definitive proof of a violation of the Act. See National Realty & Construction Company, supra. In determining the degree of injury, if any, likely to have occurred, consideration must be given to the amount of water in the pit, the amount of molten metal likely to overflow and the unusual design of respondent's melt shop.

Complainant cites the case of Babcock & Wilcox Co., __ OSAHRC __, 7 BNA OSHC 1194, 1979 CCH OSHD ¶ 23,352 (No. 77-3575-A, 1979), appeal filed, No. 79-1371 (3rd Cir., March 26, 1979), wherein Judge Tenney determined a willful violation of section 5(a)(1) to have occurred where water in a sizeable quantity was located on the floor of the "T" melt furnace. The hazard in Babcock & Wilcox existed on an open floor where there was nothing to absorb or lessen the intensity of the explosion. The melt shop in Babcock & Wilcox did not have a tapping below ground level and employees were in the direct line of an explosion. There was no type of

---

employees were told to take protective cover in the event of an explosion because of dust coming from the rafters (Tr. 354). He considered a tap with some water in the pit to be a safe procedure because of the size of the pit and the fact the ladle left little room for anything to escape from the pit (Tr. 317-318, 320).

impediment to protect the employee, and the quantity of water present was much greater than that existing in the pit to the number eight furnace.

Respondent's melt shop is unusual within the steel industry. It is referred to as a "one level" melt shop since the furnaces are located on ground level. Most melt shops are two-level shops where the ladle is located in the open at ground level and the furnace is on a platform above the ladle. The melt shop in Babcock & Wilcox, supra, was a two-level melt shop and employees were in the direct line of any explosion that might occur. Complainant's arguments fail to recognize the physical difference between "one level" and "two level" melt shops, and the rationale of Babcock & Wilcox is clearly distinguishable.

The water present in the tapping pit on April 17 formed a puddle two and a half to three feet in diameter and was perhaps three inches deep in the center of the pit. The intensity of any explosion would by necessity be limited by the amount of water in the pit. Moreover, any reaction would occur at least 35 feet (depth of the pit) from any employee and no employees would be in the direct line of the explosion. Any molten metal not absorbed by the walls of the pit and the ladle would be directed straight upward in the narrow space along the sides of the ladle. The only potential for injury would occur after the molten metal had expended all its upward force and was returning to earth by force of gravity.

Dr. J. Gerin Sylvia testified on behalf of complainant that there was no safe quantity of water or dampness[6/] in a tapping pit (Tr. 260). However, he conceded that the force of energy resulting from an explosion is going to be the strongest at the point of the explosion and will weaken as it tends to go out (Tr. 249).

---

6/ Dampness was defined as water that is not collected (Tr. 252).

According to him, some of the energy force from an explosion resulting from molten metal covering water would go outward and against the walls of the pit and some would go upward (Tr. 262). He would expect the largest amount of any molten metal from an explosion to hit the bottom of the ladle (Tr. 267). According to him, the danger from an explosion in a pit would occur from the fallout (Tr. 247-248). However, his testimony borders on the theoretical since he has never seen respondent's tapping pits nor has he ever witnessed a reaction of molten metal and water in a tapping pit of the type used by respondent (Tr. 248).

The design of respondent's melt shop eliminated the potential for any serious physical harm or death whenever a tap was made with a small quantity of water in a pit. A substantial portion of the force of the explosion would never be directed upward since it would be absorbed by the walls of the pit and the 90-ton ladle positioned in the pit (Tr. 262, 270, 328). Since the ladle covers a substantial portion of the pit, it would absorb most of the force and deflect molten metal from its upward path back to the bottom of the pit (Tr. 270).

Complainant offered no evidence of any past injuries except for the minor injury incurred by the third helper on April 17, 1979. He received minor burns that required no hospitalization. The burns suffered by him were of such little consequence that he continued to work for approximately 30 minutes prior to going to the plant hospital. The evidence indicates that employees have never suffered any serious injuries during the tapping process (Tr. 214, 318, 352). This record undoubtedly resulted from the design of the pits and the fact that taps were not permitted with large amounts of water in the pits.

Respondent had determined that it could tap with limited amounts of water in the pits without exposing employees to serious physical harm or death. The unique construction of the pits and the positioning of the ladles in the pits prior to a tap

eliminated the potential for serious physical harm or death. The wisdom of this judgment is amply supported by the facts of record. The hazard to which employees were exposed was not likely to cause death or serious physical harm. In view of this determination, the alleged section 5(a)(1) violation is vacated.

Item one of the willful citation stated as follows:

> On or prior to 4-25-79, electric furnaces in the melt shop were being tapped when dampness or a liquid was present in the tapping pit(s) which did and could have resulted in the entrapment of the liquid or dampness by molten steel creating an explosion.

Complainant's evidence was directed to events that occurred on April 17 and April 25, 1979. At the close of complainant's case, respondent moved to have the case dismissed. The motion was granted with respect to any allegation that a violation occurred on April 25, 1979 (Tr. 342-344).

Compliance Officer Rene Ritz testified that during the inspection on April 25, 1979, she noticed water or some type of liquid in the bottom of the pit to number nine furnace. The liquid appeared to her to be water. However, she further testified that the furnace was not being charged at the time of the inspection. The furnace had been used earlier during the day of the inspection (Tr. 21-22, 37, 41-42, 46, 90, 100-101). She did not observe any water in the pits of the four furnaces in use at the time of her inspection (Tr. 37). Compliance Officer James Szakovits testified that he observed an accumulation of some type of liquid in the bottom of the pit for furnace number nine (Tr. 97, 121-122). However, he also acknowledged that the furnace was not in operation (Tr. 98).

While respondent considered its operating procedure prior to April 17, 1979, to be safe, improved procedures for controlling water in the tapping pits were given to all supervisory personnel in the melt shop on April 23, 1979, and relayed to the other employees in safety meetings. The new procedures required that water which

could not be pumped from the pit be covered with sand and a clam bucket used to hoist up the wet sand prior to tapping. Since the furnace was not in operation, there was no necessity to remove the water in the pit. No employees were exposed to any hazard on April 25, 1979.

## FINDINGS OF FACT

The following facts are specifically determined in resolving the issues in dispute:

1. Respondent is engaged in business as a manufacturer of steel and maintains its principal place of business at 4000 Mahoning Avenue, Warren, Ohio (Para. I, Complaint and Answer).

2. During the afternoon of April 25, 1979, Compliance Officers Rene Ritz and James Szakovits conducted an inspection at respondent's melt shop (Tr. 18-20, 35, 89, 94-95, 97).

3. The inspection resulted from a complaint alleging water in the pits located in the melt shop (Tr. 19-20). During the inspection, the compliance officers discussed an accident that occurred on April 17, 1979 (Tr. 25).

4. Respondent's melt shop contains five 90-ton electric arc furnaces (Tr. 21, 34, 74, 97, 163, 320-321, 346-347). The furnaces are located on the ground level (Exs. 1, C; Tr. 31-32).

5. The furnaces are "tapped" at the end of a heat of steel into 90-ton "bottom pour" ladles which are placed, prior to the tap, in concrete tapping pits located below ground level (Exs. C, D; Tr. 34, 85, 96-97, 210, 346-349).

6. The tapping pits in which the ladles are positioned are 35 feet deep, 22 feet wide, 24 feet long and constructed of reinforced concrete three to five feet thick (Tr. 147-148, 317, 347, 352). The pit is tapered (Tr. 208, 212).

7. The ladle is positioned as close to the bottom of the pit as possible. There is approximately two feet of clearance between the walls and the sides of the ladle when it is in position in the tapping pit (Ex. D; Tr. 347).

8. During a tap, the furnace is tilted forward and empties molten metal out a tap hole, along a "runner" and into the ladle (Ex. D; Tr.147-148, 281, 347, 352).

9. Respondent's melt shop is unusual in that most melt shops are "two level" shops where the ladle is located in the open at ground level and the furnace is on a platform above the ladle (Tr. 31-33, 96-97, 117-118, 348-349).

10. At the beginning of the midnight shift on April 16, 1979,[7/] the melter, Frank Richards, and the employees assigned to furnace number eight observed water in the pit (Tr. 198, 207, 275-276, 290). The water formed a puddle two and a half to three feet in diameter and was approximately three inches deep in the center of the pit (Tr. 198, 211). It had been in the pit since Sunday night (April 15) (Tr. 207).

11. On occasion ground water will seep into a pit (Tr. 108-109, 199). There is a sump pump located in each tapping pit to control or eliminate the seepage (Tr. 110, 198-199). The sump pump normally eliminates the seepage (Tr. 200).

12. On April 17, 1979, the sump pump in the pit for furnace number eight was not working (Tr. 198-199, 325-326). The water in the pit to number eight furnace had accumulated through seepage (Tr. 199).

13. Prior to April 17, 1979, respondent's procedure for controlling water in the pits was to pump as much of the water from the pits as was possible prior to a

---

7/ Tom Gasper, a floor laborer, testified that his shift commenced at 10:30 p.m. Since an explosion occurred at 3:30 a.m. on April 17, the employees actually commenced work on April 16 (Tr. 274).

tap (Tr. 197-198, 317, 321). The water that could not be pumped out remained during a tap (Tr. 317).

14. The melter or shift superintendent generally made the decision as to whether there was enough water in the pit to require pumping (Tr. 323).

15. On the midnight shift commencing on April 16, 1979, the melter decided that the water was of such a small quantity that it could not be removed by a portable pump and no effort was made to remove the water prior to tapping the furnace (Tr. 197-198).

16. The tapping of the first heat of the shift for number eight furnace was accomplished without incident (Tr. 276).

17. The second tap on number eight furnace was a fast tap, which is an unusual tap. Slag erupted, went over all sides of the ladle, covered the water in the pit and an explosion occurred (Tr. 205, 276-277, 282, 292, 303).

18. The employees had no warning in advance of the beginning of the tap that it would be a fast tap (Tr. 281).

19. When overflow occurs during a tap, it normally flows in the direction of the runner since the ladle is usually tipped four to five inches to the front (Tr. 206).

20. As a result of the explosion, the third helper on the furnace sustained minor burns on the back of his neck (Tr. 54, 202, 277, 282, 303). After the incident, the third helper completed certain tasks around the furnace before he went to the plant hospital approximately a half hour later (Tr. 201-202, 282). After being treated at the plant hospital, he returned to complete his shift and did not miss any time from work (Tr. 54, 201-202, 282). He did not return to the plant hospital for further treatment (Tr. 286-287). None of the other employees received any kind of injury (Tr. 202).

21. An explosion will occur when molten metal covers water (Tr. 195, 218, 225).

22. Prior to and on April 17, 1979, whenever a tap occurred with any water in a pit, employees were advised to stand back from the pit or take protective cover whenever a ladle overflowed (Tr. 198, 215-216, 276, 279, 329, 354).

23. A crew of four employees, including the melter, tends two furnaces (Tr. 91). The other employees are the first, second and third melter (Tr. 170). All four of the employees were in the area when the explosion occurred on April 17, 1979 (Tr. 278).

24. On April 18, 1979, representatives of management met with representatives of the union safety committee to discuss the procedures for controlling water in the pits. A further meeting was held on April 20 (Ex. B; Tr. 203, 297, 300).

25. On April 23 copies of new procedures for controlling water in the tapping pits were given to all supervisory personnel in the melt shop and relayed to the other employees in safety meetings (Tr. 203-204, 209-210, 282-283). All melters were told not to tap if there was water in the pits (Tr. 204-205).

26. Subsequent to the April 17 explosion, respondent's new procedures required that water which could not be pumped from the pit be covered with sand and a clam bucket used to hoist up the wet sand prior to tapping (Tr. 208).

27. Prior to April 17, 1979, Victor Alberini, respondent's general supervisor of melting, was unaware of any burns suffered by any employees as a result of explosions occurring from molten metal covering water in the pits (Tr. 316, 318).

28. Prior to April 17, 1979, Alberini had received no complaints from employees concerning water in the pits (Tr. 322).

29. Respondent has a nationally recognized safety record and has had a declining injury rate since 1965. For the first six months of 1979, its injury rate was less than half of any comparable company in the industry (Exs. F, G: Tr. 364-366).

## CONCLUSIONS OF LAW

1. Respondent, at all times material to this proceeding, was engaged in a business affecting commerce within the meaning of the Act.

2. Respondent, at all times material to this proceeding, was subject to the requirements of the Act and the standards promulgated thereunder. The Commission has jurisdiction over the parties and over the subject matter herein.

3. Respondent was not in violation of section 5(a)(1) on April 17, 1979, for tapping the number eight furnace while water was in the pit. Any resulting explosion was not likely to cause death or serious physical harm due to the design of the tapping pit and the small quantity of water in the pit.

4. Respondent was not in violation of section 5(a)(1) on April 25, 1979, because water was in the pit. The furnace was not charged, and there was no employee exposure to any hazard.

## ORDER

Upon the basis of the foregoing findings of fact and conclusions of law, it is

ORDERED: 1. That item one of the willful citation issued to respondent on May 8, 1979, and the penalty proposed for the alleged violation are vacated;

2. That the stipulation and settlement agreement filed by the parties at the commencement of the hearing is approved and incorporated as a part of this order; and

3. That the serious citation, willful citation and repeated citation issued to respondent on May 8, 1979, and the penalties proposed for the

alleged violations are affirmed, modified and vacated in accordance with the terms of the settlement agreement.

Dated this 24th day of April, 1980.

| v. | : | |
| HUBER, HUNT & NICHOLS, INC., Respondent. | : | |

STIPULATION AND SETTLEMENT AGREEMENT

I

The parties have reached agreement on a full and complete settlement of the instant matter which is presently pending before the Commission upon direction of review of the judge's decision.

II

The parties stipulate as follows:

(A) The Occupational Safety and Health Review Commission has jurisdiction over this matter pursuant to section 10(c) of the Act.

(B) Respondent, Huber, Hunt & Nichols, Inc., is a corporation engaged in construction and has its principal office and place of business at P.O. Box 128, Indianapolis, Indiana. Respondent is and, was on April 29, 1981 an employer subject to the Act.

(C) As a result of an inspection conducted on April 29, 1981 at a construction worksite in Albuquerque, New Mexico, respondent was issued one citation alleging two serious violations of the Act on May 4, 1981. A notification of proposed penalty was issued the same day.

(D) By letter dated May 22, 1981 and received in the Albuquerque, New Mexico OSHA office on May 26, 1981, respondent served notice of its intent of contest the citation and proposed penalty.

(E) A Commission Judge affirmed the citations and the penalty proposed by the Secretary. Respondent thereupon filed a petition for review of the judge's decision, which was directed by Commission Chairman Rowland on December 9, 1981.

(F) The conditions alleged to have been violations of the Act in the citation and complaint no longer exist.

(G) A citation alleging the identical violations was also issued to a subcontractor on the site who was the only employer whose employees were exposed to the alleged violations. The subcontractor did not contest the citation issued to it.

III

Complainant hereby withdraws the citation and proposed penalty in the instant matter for the following reasons:

(A) The alleged violations no longer exist.

(B) Another employer, a subcontractor who was the only employer with employees exposed to the violations, received a citation identical to that received by respondent and did not contest said citation.

(C) Complainant believes that as a matter of policy further litigation of this particular case is inappropriate.

IV

Respondent has no objection to the withdrawal of the citations and proposed penalties herein and agrees that it will pay its own attorney's fees in this matter.

V

Respondent will post the instant Stipulation and Settlement Agreement in accordance with the Rules of Procedure of the Commission.

WHEREFORE, the parties agree to the withdrawal of the citation herein which is currently pending before the Commission.

DECISION AND ORDER

Appearances: Richard L. Collier, Esq., of Dallas, Texas, for the complainant.

Carl E. Clubb, safety director, of Indianapolis, Indiana, for the Respondent.

BLYTHE, Judge:

STATEMENT OF THE CASE

The sole issue in this case is whether the respondent, Huber, Hunt & Nichols, Inc., a general contractor, can be held responsible for a subcontractor's safety violations in view of the stipulated fact that none of respondent's employees was exposed to the hazards. This issue subsumes the question of whether the Secretary of Labor ("the Secretary") is bound by a Field Operations Manual provision against issuing citations to employers whose employees are not exposed.

After an inspection of respondent's workplace at 9201 Pan American Freeway, N.E., Albuquerque, New Mexico, on April 29, 1981, by a compliance officer

of the Occupational Safety and Health Administration ("OSHA"), one citation was issued to respondent May 4, 1981, alleging serious violations of §5(a)(2) of the Occupational Safety and Health Act of 1970 ("the Act") and safety standards for scaffolds codified at 29 CFR 1926 §§500(e)(1)(ii) and 451(c)(2). The citation was amended May 18, 1981, to allege a serious violation of 29 CFR 1926.451(a)(4) instead of 29 CFR 1926.500(e)(1)(ii). The respondent timely filed notice of contest May 22, 1981, thus initiating this proceeding before the Occupational Safety and Health Review Commission ("the Commission") under §10(c) of the Act. Thereafter respondent filed a request for simplified proceedings [1] which the Secretary did not oppose.

The case came on regularly for hearing in Albuquerque on September 4, 1981. No affected employee or authorized representative of affected employees participated. Respondent submitted a posthearing brief; the Secretary did not.

## DISCUSSION AND OPINION

At the workplace here involved, respondent, as general contractor, was constructing a large building on a 65-acre site for the Signetics Corporation. One of its subcontractors was Bob Davis Masonry, Inc. ("Davis"), which erected and used the two scaffolds which are the subject of the citation. Item 1a, as amended, alleges that "[h]andrails were not provided for the open ends and areas" of one of a 15-foot-high scaffold, in violation of 29 CFR 1926.

---

1 See Rules 200-211 of the Commission's Rules of Procedure.

451(a)(4) [2], and item 1b alleges a violation of 29 CFR 1926.451(c)(12)[3] in that a scaffold 15 feet high and 48 feet long was not secured to the building.

In its posthearing brief, respondent does not contend that the violations did not exist. Rather, it contends, as previously stated, that it should not have been cited because its employees were not exposed to hazards created by its subcontractor.

The answer to this contention is found in Perini Corp., 78 OSAHRC 41/C5, 6 BNA OSHC 1609, 1978 CCH OSHD ¶22,772 (No. 13029, 1978), where the Commission held a general contractor responsible for safety violations it could prevent or abate by reason of its supervisory authority over a multi-employer workplace, regardless of whether it created the hazard or whether its own employees were exposed thereto.

Respondent points out that the Secretary's Field Operations Manual, CH. X(F)(1)(b)(1), provides:

> Citations under the general duty clause and under standards will be issued only against employers where their own employees are exposed or are potentially exposed to unsafe or unhealthful conditions.

(Emphasis supplied). The case law is well settled that the Field Operations Manual provides only guidelines for compliance officers and does not confer substantive rights on employers. Combustion Engineering, 77 OSAHRC 182/A2, 5 BNA OSHC 1943, 1979-78 CCH OSHD ¶22,241 (No. 76-2210, 1977).

---

[2] This standard provides:

> Guardrails and toeboards shall be installed on all open sides and ends of platforms more than 10 feet above the ground or floor...[with exceptions not here pertinent].

[3] This standard provides, with regard to tube and coupler scaffolds:

> To prevent movement, the scaffold shall be secured to the building or structure at intervals not to exceed 30 feet horizontally and 26 feet vertically.

Respondent further contends that "the violative conditions were not obvious to the casual observer, and would require almost moment-to-moment observation if they were to be discovered." (Brief, P.5). The scaffold on which guardrails were absent was about 100 feet directly in front of respondent's office and had been in use by Davis' bricklayers two days (Tr.14-15). The scaffold involved in item 1b adjoined the other on one end but was around a corner of the building and had also been used two days by Davis' employees (Tr.32).

Compliance Officer Ambrose Claus testified that the scaffold in item 1a was in plain view (Tr.16) and that the lack of a tie to the building on the scaffold in item 1b could be detected from a distance of 20 or 25 feet by looking between the scaffold and the building (Tr.35).

In Knutson Construction Co., 76 OSAHRC 131/F3, 4 BNA OSHC 1759, 1976-77 CCH OSHD ¶21,185 (No. 765,1976), aff'd., 566 F.2d 596 (8th Cir. 1977), the Commission held a general contractor responsible for detecting the lack of guardrails on a scaffold but not for a hidden crack which caused a scaffold to collapse but which the respondent could not reasonably be expected to detect or prevent.

It is clear that under Knutson the respondent here should have been able to detect the absence of guardrails. The absence of a tie-in to the building on the other scaffold is a closer question because it was not so obvious. However, I find that it was not unreasonable to expect respondent to detect the lack of a tie to the building.

Respondent's general superintendent and safety officer, Dan Holmberg, made daily tours of the project and weekly safety inspections (Tr.92,100). He had

never noticed any safety violations on the scaffolds here involved but if he had he would have required Davis to correct them, he testified (Tr.102). However, he said he just looked for obvious violations (Tr.102). This is not sufficient.

Respondent points out (Brief, P.2) that Davis' subcontract (Exhibit R-1) required Davis to furnish all scaffolding and supervision in connection with the masonry work. The contract also required Davis to comply with OSHA regulations and made it "responsible for any costs, damages or penalties that Huber, Hunt & Nichols, Inc., may suffer or incur as a result of any violation of such regulations by the subcontractor, his agents or employees". However, it is well settled that an employer cannot by contract absolve itself of its responsibilities under the Act. Bill C. Carroll Co., Inc., 79 OSAHRC_____, 7 BNA OSHC 1806, 1979 CCH OSHD ¶23,940 (No. 76-2748, 1979).

I find the respondent in violation of both standards as charged and that these violations were serious. The compliance officer testified without contradiction that the likely result of a 15-foot fall from these scaffolds would be serious fractures (Tr.21).

There remains the assessment of an appropriate penalty, the Secretary having proposed an aggregate penalty of $360.

Section 17(j) of the Act requires the Commission, in assessing penalties, to consider the gravity of the violation and the employer's size, good faith and history of previous violations. These factors need not be accorded equal weight, but the gravity is usually of greater significance than the others. Colonial Craft Reproductions, 72 OSAHRC 11/B10, 1 BNA OSHC 1063, 1971-73 CCH OSHD ¶15,277 (No. 881,1972). Elements to be considered in determining gravity include the number of employees exposed to the risk of injury,

duration of the exposure, precautions taken against injury, and the degree of probability of occurrence of an injury. National Realty & Construction Co.,Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶15,188 (No. 85, 1972) rev'd on other grounds, 489 F.2d 1257 (D.C. Cir., 1973).

After considering these criteria, I find the proposed penalty of $360 appropriate.

## FINDINGS OF FACT

1. The respondent, Huber, Hunt & Nichols, Inc., is a large construction company which on April 29, 1981, was a general contractor engaged in the construction of a large building for Signetics Corporation at Albuquerque, New Mexico. It was engaged in a business affecting commerce and had employees within the meaning of §3(5) of the Act.

2. Two 15-foot-high tube and coupler scaffolds on this workplace erected and used by a subcontractor, Bob Davis Masonry, Inc., were in violation of 29 CFR 1926 §§451(a)(4) and 451(c)(12) in that one lacked guardrails on the open ends and at places left open for offloading materials and the other, which was 48 feet long, was not tied to the building.

3. It was reasonable to expect the respondent, in its supervisory capacity as general contractor, to detect these violative conditions and require them to be corrected. These conditions had existed two days prior to the inspection. The lack of guardrails was readily apparent, and the lack of a tie to the building could have been detected by a reasonably thorough safety inspection.

4. There was a substantial probability that death or serious physical injury could result from these vioaltions.

5. A penalty of $360 is appropriate.

## CONCLUSIONS OF LAW

1. The Commission has jurisdiction of the parties and of the subject matter of this proceeding.

2. On April 29, 1981, the respondent was in serious vioaltion of 29 CFR 1926 §§451(a)(4) and 451(c)(12).

## ORDER

It is ORDERED that:

1. Item 1a of citation 1, for serious violation of 29 CFR 1926.451(a)(4), is AFFIRMED.

2. Item 1b of citation 1, for serious violation of 29 CFR 1926.451(c)(12), is AFFIRMED.

3. An aggregate penalty of $360 is ASSESSED.

| v. | : | OSHRC Docket No. 76-2165 |
| BJ-HUGHES, INC., | : | |
| Respondent. | : | |
| | : | |

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Louis G. LaVecchia is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act" or "the OSH Act"). Judge LaVecchia affirmed a citation issued by the Secretary of Labor to Respondent, BJ-Hughes, Inc. ("Hughes"), for its failure to require an employee to use a safety belt while exposed to a falling hazard during offshore oil drilling operations. The Secretary alleged noncompliance with the construction safety standard at 29 C.F.R. § 1926.28(a).1/

---

1/ The standard provides:

> § 1926.28 Personal protective equipment.
>
> (a) The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees.

On review, Hughes argues that the construction industry standards found in Part 1926 of 29 C.F.R. do not apply to oil drilling operations. Hughes also, for the first time, moves to dismiss for lack of subject matter jurisdiction. Hughes argues that the Coast Guard has exercised authority over safety conditions on offshore drilling rigs and that section 4(b)(1) of the Act[2/] therefore precludes the Secretary from regulating safety conditions on these drilling rigs. Hughes states that the Coast Guard has exercised authority granted by the Outer Continental Shelf Lands Act of 1953, 43 U.S.C. §§ 1331 et seq., by issuing regulations, found at 33 C.F.R. Parts 140-147, concerning safety conditions on offshore drilling rigs. The Secretary contends that Hughes was engaged in construction work but, alternatively, moves to amend the citation to allege that Hughes failed to comply with the general industry standard at 29 C.F.R. § 1910.132(a)[3/] or section 5(a)(1) of

---

2/ Section 4(b)(1) of the Act, 29 U.S.C. § 653(b)(1), provides, in pertinent part:

> Nothing in this chapter shall apply to working conditions of employees with respect to which other Federal agencies . . . exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health.

3/ 29 C.F.R. § 1910.132(a) concerns personal protective equipment and provides:

> § 1910.132 General requirements.
>
> (a) Application. Protective equipment, including personal protective equipment for eyes, face, head, and extremities, protective clothing, respiratory devices, and protective shields and barriers, shall be provided, used, and maintained in a sanitary and reliable condition wherever it is necessary by reason of hazards of processes or environment, chemical

(continued on next page)

the Act[4/] in the event section 1926.28(a) is found not to apply.

We agree with Hughes that the construction industry standards do not apply to oil drilling operations. Accordingly, section 1926.28(a) is inapplicable and the parties' motions remain to be considered. We remand the case to the judge for him to consider the motions.

I

Hughes is a corporation providing cement service work to oil drilling companies.[5/] On March 20, 1976, Hughes was cementing pipe at the Nicklos Drilling Rig 30 located about twenty-five miles southeast of Galveston, Texas. An employee, the service engineer, was hoisted by an air hoist cable[6/] to the top of the casing surrounding the pipe. The

---

3/ (continued)

> hazards, radiological hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact.

4/ Section 5(a)(1), 29 U.S.C. § 654(a)(1), provides:

> Sec. 5(a) Each employer —
>
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees[.]

5/ The casings of wells are cemented to isolate the oil zone from possible contamination by water or gas. In this process, concrete is pumped down the inside and up around the outside of the casing and allowed to set. After it sets, some of the concrete is left inside the pipe until the drilling company drills the residue out as the company either completes or continues to deepen the well.

6/ The air hoist is similar to a winch in that it is bolted to the derrick floor and the cable is routed through a pulley up in the derrick. The cable is secured to a riding belt fastened by the employee around his waist and under his hips.

casing was supported by an "elevator" around which ran a one-foot wide ledge. The service engineer disengaged himself from the air hoist cable and stepped onto the ledge. He then proceeded to guide the top cementing plug into the casing while he was not secured by any line, rope, safety belt or other protective device. Shortly thereafter, pressure in the casing propelled the plug out of the casing. The plug struck the service engineer and knocked him off the ledge to the drilling rig floor fifty feet below. He died from the injuries received in this accident.

On March 24, 1976, the worksite was inspected by a United States Department of Labor compliance officer. On April 15, 1976, the Secretary issued a citation alleging that Hughes failed to comply with section 1926.28(a). Judge LaVecchia affirmed the citation.[7/] The judge concluded that section 1926.28(a) applies to oil drilling operations. He further concluded that the facts surrounding the fatal accident demonstrated that Hughes violated the cited standard.

II

Hughes filed a petition for discretionary review, which was granted by former Commissioner Barnako. In its petition, Hughes argued that section 1926.28(a) does not apply to oil drilling operations and that, if it does, the standard is not violated. Hughes further argued that

---

7/ In prior proceedings in this case, Administrative Law Judge Robert N. Burchmore granted a motion by Hughes to dismiss for lack of proper service. On June 29, 1979, the Commission reversed Judge Burchmore's decision vacating the citation and remanded the case for findings of fact and conclusions of law on the merits. B.J. Hughes, Inc., 79 OSAHRC 49/E6, 7 BNA OSHC 1471, 1979 CCH OSHD ¶ 21,515 (1979). Because Judge Burchmore was no longer with the Commission, the case was assigned to Judge LaVecchia.

the only possibly applicable standard was section 1910.132(a), the general industry standard on personal protective equipment. However, Hughes argued that a violation of this standard was never charged and was not tried by consent at the hearing.

On review, the Secretary argues that section 1926.28(a) applies because Hughes' cementing work for oil drilling is construction work within the meaning of the definition of "construction work" at 29 C.F.R. § 1910.12(b).[8/] The Secretary argues that construction work is fabrication or putting parts together to form a complete and integrated object. He concludes that Hughes' cementing process is construction work since it involves the construction of a wall in the hole. The Secretary also points out that Hughes' employees work with pumps, derricks, concrete pouring equipment, and material handling equipment. Since Hughes' work involves equipment typically used in construction work, the Secretary argues that the construction standards apply.

The Secretary also argues that, if section 1926.28(a) does not apply, then section 1910.132(a) applies and requires Hughes to use safety belts to protect employees from fall hazards. The Secretary alternatively argues that he has established a violation of section 5(a)(1) of the Act.

---

8/ 29 C.F.R. § 1910.12(b) provides:

> § 1910.12 Construction work.
>
> * * *
>
> (b) Definition. For purposes of this section, "construction work" means work for construction, alteration, and/or repair, including painting and decorating. . . .

The Secretary accordingly moves to amend the citation to allege violations of these provisions.[9/]

III

We have previously stated that the construction standards only apply to actual construction work or to related activities that are an integral and necessary part of construction work. Activities that could be regarded as construction work should not be so regarded when they are performed solely as part of a nonconstruction operation. Royal Logging Co., 79 OSAHRC 84/A2, 7 BNA OSHC 1744, 1979 CCH OSHD ¶ 23,914 (No. 15169, 1979), aff'd, 645 F.2d 822 (9th Cir. 1981).

As the Secretary argues, the cementing process could be regarded as construction work. However, the process is performed as an integral and indispensable part of drilling an oil well. See Royal Logging Co., supra. Therefore, even accepting the Secretary's position, the question under Royal Logging Co. is whether the entire process of drilling an oil well is construction within the meaning of section 1910.12(b), note 8 supra.

Section 1910.12(b) defines construction work as "work for construction, alteration, and/or repair, including painting and decorating." The terms in this definition are not further defined. However, the standards in Part 1926 of 29 C.F.R., which apply to construction work, indicate the

---

9/ Hughes opposes the Secretary's motion to amend on the basis that the amendments are prejudicial because four years have passed since the accident. Hughes also argues that section 1910.132(a) does not include safety belts as a form of personal protective equipment. Hughes further contends that amendment to section 5(a)(1) adds new, untried issues and that this amendment is not before the Commission for review because the issue of possible noncompliance with section 5(a)(1) was not included in the direction for review.

type of work which the Secretary considered to fall within the definition. Among the standards in Part 1926 that might apply most directly to oil drilling operations are standards covering "Excavations, Trenching, and Shoring" (Subpart P), "Concrete, Concrete Forms, and Shoring" (Subpart Q), and "Tunnels and Shafts, Caissons, Cofferdams, and Compressed Air" (Subpart S). However, there are in these subparts no standards which refer specifically to oil drilling operations. Moreover, the Secretary has not pointed to any standard in Part 1926 which has specific reference to oil drilling or related activities. Thus, we conclude that the Secretary did not specifically consider oil drilling to be construction work when he promulgated the standards in Part 1926.

Moreover, we are not persuaded by the Secretary's argument that Respondent's cementing work for oil drilling operations involves equipment typically used in construction. The same can be said of work which the Secretary has not considered to be construction work. Cf. General Electric Corp., 81 OSAHRC 97/D6, 10 BNA OSHC 1144, 1981 CCH OSHD ¶ 25,736 (No. 76-2879, 1981)(citation alleging noncompliance with the general industry standard requiring a standard railing to guard open-sided floors or platforms, rather than the construction standard stating an identical requirement, where employees were performing drilling and other work on the joints of cast turbine generator shells); Allis-Chalmers Corp., 76 OSAHRC 50/F8, 4 BNA OSHC 1227, 1975-76 CCH OSHD ¶ 20,666 (No. 5210, 1976) (citation alleging noncompliance with the general industry floor or platform guarding standard, rather than the construction floor or platform guarding standard, where employees were constructing and testing power transformers). Moreover, for many of the Part 1926 standards that regulate equipment used in construction work, there are corresponding general industry standards in

Part 1910 regulating the same type of equipment.[10/] Because the Secretary has not shown that the oil drilling process constitutes construction, we conclude that section 1926.28(a) does not apply to Respondent's cement servicing operations. See United Geophysical Corp., 81 OSAHRC 77/D6, 9 BNA OSHC 2117, 1981 CCH OSHD ¶ 25,579 (No. 78-6265, 1981), appeal filed, No. 81-4342 (5th Cir. August 26, 1981).

IV

Although we conclude that section 1926.28(a) does not apply, the Secretary's motion to amend remains to be resolved. Moreover, Hughes has filed a motion to dismiss relying on section 4(b)(1) of the Act. We conclude that the parties should have the opportunity to present evidence and argument on the merits of the section 4(b)(1) issues raised in the motion. Accordingly, we remand the case for further proceedings. If the judge concludes that section 4(b)(1) does not exempt the cited working conditions from the Act, he should rule on the Secretary's motion to amend the citation to allege violations of either section 1910.132(a) or section 5(a)(1) of the Act. See Texaco, Inc., 80 OSAHRC 68/A2, 8 BNA OSHC 1677, 1980 CCH OSHD ¶ 24,574 (No. 77-2014, 1980). SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: MAR 31 1982

---

10/ For example, the general industry scaffolding standards at § 1910.28 are very similar to the construction standards at § 1926.451.

Cleary, Commissioner, concurring:

I agree with my colleagues that the construction industry standards do not apply to oil drilling operations. I also agree to remand this case for consideration of Hughes' motion to dismiss based on section 4(b)(1). However, I cannot agree with the conclusory manner in which my colleagues dispose of Hughes' motion and the Secretary's motion to amend the citation.

We have previously held that section 4(b)(1) does not limit the Commission's subject matter jurisdiction, but rather provides an employer with an affirmative defense which must ordinarily be raised before the administrative law judge. Allegheny Airlines, Inc., 81 OSAHRC 37/A14, 9 BNA OSHC 1623, 1981 CCH OSHD ¶ 25,339 (No. 14291, 1981), appeal filed, No. 81-1528 (4th Cir. June 19, 1981). Only in extraordinary circumstances will the Commission address a nonjurisdictional issue that was not raised before the administrative law judge. Commission Rule 92(d), 29 C.F.R. § 2200.92(d); Willamette Iron & Steel Co., 81 OSAHRC 59/A2, 9 BNA OSHC 1900, 1905, 1981 CCH OSHD ¶ 25,427 at p. 31,700 (No. 76-1201, 1981).

In A. Prokosch & Sons Sheet Metal, Inc., 80 OSAHRC 96/A2, 8 BNA OSHC 2077, 1980 CCH OSHD ¶ 24,840 (No. 76-406, 1980), the Commission concluded that there were extraordinary circumstances within the meaning of Commission Rule 92(d) for the Commission to decide an issue not raised until review. The Commission acknowledged that it had decided two other cases in favor of employers on the basis of the issue which Prokosch sought to interject into the case for the first time on review. The Commission concluded, "The goal of uniform application of the Act therefore requires that we consider that issue as it relates to Prokosch." 8 BNA OSHC at 2079, 1980 CCH OSHD at p. 30,627.

Several Courts of Appeals have also considered the question of extraordinary circumstances justifying a party in raising an issue late in the proceedings.[1/] The 6th Circuit in RMI v. Secretary of Labor, 594 F.2d 566 (6th Cir. 1979), and the 9th Circuit in Todd Shipyards v. Secretary of Labor, 586 F.2d 683 (9th Cir. 1978), both decided that, where the employers relied upon cases that were decided after the employers had presented their arguments to the Commission, extraordinary circumstances justified consideration of the issues which were raised for the first time on appeal. In RMI v. Secretary of Labor, the court decided that, because the case on which RMI relied held that the Secretary, not the employer, had the burden of proof on the issue which RMI sought to raise on appeal, it "would be fundamentally unfair to bar RMI" from arguing on appeal an issue which RMI did not earlier know was an element of the Secretary's proof. In Todd Shipyards v. Secretary of Labor, the employer relied on the Supreme Court's decision in Marshall v. Barlow's, Inc., 436 U.S. 307 (1978), which was decided after the employer's appeal to the court. The court expressed concern about precluding an employer from arguing a fundamental question recently addressed in a potentially controlling case.[2/]

---

1/ Section 11(a) of the Act, 29 U.S.C. § 660(a), provides, in pertinent part:

> No objection that has not been urged before the Commission shall be considered by the court, unless the failure or neglect to urge such objection shall be excused because of extraordinary circumstances. . . .

2/ The Court of Appeals for the 5th Circuit in Power Plant Division, Brown & Root, Inc. v. OSAHRC, F.2d (No. 79-3677, 5th Cir., Unit B. Oct. 26, 1981), has cited these cases with approval, noting that in each the issues were permitted for the first time on appeal because the employers relied on cases decided after argument to the Commission.

In support of its section 4(b)(1) argument, Hughes relies on a decision of the Federal District Court for the Eastern District of Texas, Marshall v. Nichols, 486 F. Supp. 615 (E.D. Tex. 1980), rev'd on other grounds, 646 F.2d 190 (5th Cir. 1981), which was decided after review was directed in this case. The District Court stated that the Coast Guard, United States Geological Survey, and the Interior Department have issued regulations governing the employment relationship on offshore drilling platforms in its entirety. The court concluded that by enacting the Outer Continental Shelf Lands Act, Congress intended to exclude the working conditions on offshore drilling platforms from the coverage of the OSH Act. Accordingly, that court stated that section 4(b)(1) of the OSH Act precludes the Secretary from asserting jurisdiction over working conditions on the outer continental shelf.

If Marshall v. Nichols is correct, the working conditions in this case are entirely exempt from the coverage of the Occupational Safety and Health Act of 1970. Thus, in relying on Marshall v. Nichols, Hughes questions the Secretary's authority to apply the OSH Act to any working conditions on the outer continental shelf. The goal of uniform application of the Act requires that we address the questions raised by Hughes. Accordingly, I agree with the majority in remanding this case.

Since both parties' motions to amend their pleadings were made on review for the first time and I would find extraordinary circumstances justifying consideration of Hughes' motion, considerations of fairness require that the Secretary's motion to amend also be addressed. Therefore, I agree with my colleagues' directions to the judge for consideration of this motion.

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | | |
|---|---|---|
| SECRETARY OF LABOR, Complainant, | : | |
| v. | : | OSHRC Docket No. 76-2165 |
| B. J. HUGHES, INC., Respondent. | : | |

APPEARANCES:

Allen L. Prince, Esquire, for the Complainant.

Clinton S. Morse, Esquire, for the Respondent.

DECISION AND ORDER ON REMAND

Louis G. LaVecchia, Judge

This is a proceeding under section 10(c) of the Occupational Safety and Health Act of 1970 (29 U.S.C. 751, et seq.). The Review Commission, by order dated June 29, 1979, remanded the case to the undersigned for findings of fact and conclusions of law on the merits, after reviewing the decision of a judge since retired from the Commission. The merits had not been reached in the prior decision.

By citation issued on April 15, 1976 complainant charged that respondent committed a serious violation of section 5(a)(2) of the Act for failure to comply with the standard at 29 CFR 1926.28(a).

The standard provides:

> "(a) The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees."

## The Facts

Respondent is a wholly owned subsidiary of Hughes Tool Company and engages in a number of enterprises including the servicing of drilling rigs and wells throughout the United States. (Tr. 14). It employed about 1,237 individuals, primarily involved in providing cement service work to oil drilling companies. (Tr. 14-15). Service employees are assigned to particular stations under the charge of a district superintendent. (Tr. 20). After receiving a work request dispatchers at each station assign a work crew to proceed to the well site to accomplish the job. (Tr. 22-23). Crews travel to off-shore drilling rigs via helicopter or crew boats provided by the drilling contractors or rig operators. (Tr. 23-24).

Each work crew is under the direction of a company service engineer who is responsible for performing the job satisfactorily. (Tr. 18). This individual is also responsible for on-the-job enforcement of the respondent's safety rules. (Tr. 25).

Since at least 1967 the company employee handbook and safety manual has contained a rule requiring that safety belts be worn whenever work was being performed at a height in excess of 10 feet from the ground. (Tr. 79, Ex. R2, R3, R5).

Ordinarily, in off-shore operations, a crew of two employees consisting of a Service Engineer and an assistant is used. The Service Engineer is charged with the satisfactory performance of the required work, as well as the accomplishment of the job in a safe manner. (Tr. 18).

On March 20, 1976, respondent's employee, Bobby Ray Bobbitt, was the service engineer in charge of a cementing operation being performed at Nicklos Drilling Rig No. 30, about 25 miles southeast of Galveston, Texas, when he fell from a derrick to the rig floor about 50 feet below. (Tr. 26-28). He had been raised to the top of a casing surrounding the drill pipe. The casing was supported by objects termed "elevators." The elevators were surrounded by a 1-foot wide ledge. Bobbitt disengaged himself from the line that secured him to the derrick, and stood on the ledge, free of any protective lines, ropes, or other type of safety equipment. (Tr. 32). Casing elevators are about 3 or 4 feet in diameter. (Tr. 30). Bobbitt used the line attached to the air hoist (derrick) to secure the cap at the top of the casing; then he removed the cap; and the cap was then moved to the casing elevators by the operator of the derrick. (Tr. 31). The line was then undone by Bobbitt and sent to the floor of the rig. (Tr. 31). The operator below assumed that Bobbitt was holding onto a valve supporting the elevator. (Tr. 32). He had no lanyard attached to his safety belt. (Tr. 34). The derrick operator was of the opinion that a lanyard (line) could have been tied around the casing valves by Bobbitt. (Tr. 34). The operator had seen the cementing operation done on previous occasions, and

at times the individuals performing the cementing operation at the top of the casing had tied themselves off with a lanyard attached to a safety belt. On other occasions the persons so engaged had not tied themselves off in that manner. (Tr. 34-35). A second air hoist (derrick) was available for use at the time, but was not requested by Bobbitt. (Tr. 33). The air hoist belt was not a safety belt in the usual sense of the word. It was more like a boatswain's chair, strapping around the hips, and was the property of the drilling company, not the respondent. (Tr. 41). An employee of respondent engaged in the same type of cementing operation on drill rigs, and with 15 years' experience in drilling operations, had seen cementing operations conducted by others. In some instances, the employees removed themselves from the derrick straps in the manner that Bobbitt did, and in other instances they worked with the straps on. (Tr. 40). He had never seen such employees using safety belts until after the death of Bobbitt. (Tr. 42). There was a rule that the safety belts be used, but it had not been enforced prior to the accident. (Tr. 42). After the fatal accident the rule was enforced, requiring employees performing similar operations to use a safety belt and lanyard, and to tie off. Although the line may get in the way of the worker, it does not prevent the job from being done. (Tr. 43).

The safety handbook distributed by respondent to its employees requires that safety belts be worn with an attached safety line any time an employee is working more than 10 feet above the floor. (Tr. 44; Ex.R3, "On the Job" rule 9.) Safety meetings were held at respondent's district

offices once a month, and now are held every two weeks. (Tr. 45). The company did not provide safety belts at jobsites before the fatal accident, but afterwards all units and all offshore rigs were provided such equipment. (Tr. 48). Another of respondent's employees, engaged in the same occupation as the deceased employee, i.e., Service Engineer,[1/] for 10 years with respondent, indicated that he had never had or used a safety belt prior to the accident. (Tr. 51). He stated that in performing cementing operations at heights, the air hoist line was sent down to the working surface for picking up and returning above the necessary materials. He would stand on the elevators, although the portion stood upon was not meant for that purpose. (Tr. 52). There was nothing to prevent a free fall from the elevator lips (protrusions). (Tr. 53). He now performs such work with the safety belt and line attached, without significant inconvenience. (Tr. 53). At company safety meetings the use of safety belts was generally discussed. (Tr. 56). After the fatality, and upon advising the company representative that he had no safety belt, one was provided for him. (Tr. 57). It was a new one. (Tr. 57). He knew of employees being reprimanded for not wearing hard hats on the job, but had not heard of anyone being reprimanded for not wearing a safety belt. (Tr. 62).

Respondent's safety director of 10 years stated that he recalled one previous accident involving a worker falling from a derrick when he failed

---

1/ This appears to be a title used by respondent for want of a better description of the employee's duties. It is noted that Bobbitt was a high-school graduate. (Ex. R-1).

to use a safety belt and lanyard. He sustained broken bones, but recovered from his injuries. (Tr. 81).

## Discussion and Conclusions

The respondent challenges the applicability of 29 CFR 1926.28(a) to the alleged violation on the theory that this standard is one of the regulations adopted for controlling the construction industry, and that the operations here involved should not be construed to be construction work. I would agree that drilling for oil or gas is not a construction enterprise. However, 29 CFR 1910.5(c) provides that "any standard shall apply according to its terms to any employment and place of employment in any industry, even though particular standards are also prescribed for the industry, * * * to the extent that none of such particular standards applies..." Accordingly, I find that 29 CFR 1926.28(a) applies to oil and gas drilling operations similar to those here considered.

As to the substantive violation, assuming the applicability of the challenged standard, the respondent argues that either a safety belt, a shoulder strap belt, or a riding belt effectively prevents an employee from suffering an accidental fall. It is suggested that Bobbitt, who wore a riding belt when lifted to the point from which he fell, violated company policy when he disconnected the lanyard from his riding belt. And it is further argued that in the exercise of reasonable diligence the respondent could not have known of the violation of the safety standard.

The respondent submits that when a violation results from the misconduct of a supervisor or foreman (Bobbitt) the foreman's knowledge cannot be imputed to the employer to establish knowledge, actual or implied, of the violation, citing Horne v. OSHRC, 528 F.2d 564 (5th Cir. 1976), 1975-76 CCH OSHD para. 20,504. But in that case the employer had done everything possible to insure that his safety program was carried out. That was not the case here. The evidence shows quite clearly that employees performing the same operation as Bobbitt commonly worked without a safety belt. Although the company's safety manual prescribed the use of safety belts when working more than 10 feet above a floor, the rule was not enforced. The company's laxity in this respect was well known among its employees. A similar accident had happened in the past, serving notice upon respondent that its safety program needed tightening up, but no such action had been taken. No disciplinary action appears to have been taken against respondent's employees for infractions of the rule concerning safety belts. The fact that Bobbitt was a foreman does not exonerate respondent in the circumstances shown here. In Floyd S. Pike Elec. Contr. v. OSHRC and the Dept. of Labor, 576 F.2d 72 (5th Cir. 1978), 1978 CCH OSHD para. 22,855, the court cited with approval the following language from National Realty v. OSAHRC, 489 F.2d 1257:

> Because the behavior of supervisory personnel sets an example at the workplace, an employer has--if anything--a heightened duty to ensure the proper conduct of such personnel. Second, the fact that a foreman would feel free to breach a company safety policy is strong evidence that implementation of the policy was lax.

I can only conclude that respondent violated the safety standard set forth at 29 CFR 1926.28(a)

The violation charged was properly categorized as "serious" within the meaning of section 17(k) of the Act (29 U.S.C. sec. 666(j)), in view of the death of respondent's employee from the accident, and in the light of my conclusion that respondent had the requisite knowledge of the presence of the violation.

Considering the proposed penalty under section 17(j) of the Act (29 U.S.C. sec. 666(i)) leads me to conclude that the $550 penalty proposed for this serious violation strikes a reasonable balancing of the factors.

## Findings of Fact

The evidence of record having been considered and evaluated in its entirety, the following facts are specifically found:

1. Respondent maintains an enterprise for the servicing of drilling rigs and wells throughout the United States.

2. Respondent operates in interstate commerce.

3. On March 20, 1976 one of respondent's employees was killed when he fell from a derrick to a rig floor about 50 feet below while not wearing a safety belt and lanyard.

3. The deceased employee had disengaged himself from a safety chair attached to the derrick in order that the device be used for raising required equipment from the floor of the rig to the point at which the employee was working.

4. The safety chair or sling was not the property of respondent, but belonged to the drilling company.

5. The deceased employee was not wearing a safety belt and lanyard provided by the respondent.

6. Although the respondent had a safety rule requiring the use of a safety belt when its employees were working more than 10 feet above a floor, the rule was generally ignored by its employees.

7. The respondent knew or in the exercise of reasonable diligence should have known of the violation of its rule requiring the use of safety belts.

8. The respondent's safety training program was essentially ineffective, and disciplinary measures against employees violating the safety rules were not implemented in a manner to achieve compliance.

9. There had been at least one other accident similar to that which occurred on March 20, 1976, and the respondent was aware of it.

10. The deceased employee's misconduct was imputable to the respondent in the circumstances shown.

## Conclusions of Law

1. At all times material hereto respondent was an employer within the meaning of section 3(5) of the Act, engaged in a business affecting commerce, and having employees.

2. The Occupational Safety and Health Review Commission has jurisdiction over the parties and the subject matter herein.

3. The citation, the notification of proposed penalty, and the notice of contest were served by and upon the respective parties in

accordance with section 10 of the Act.

4. The respondent violated the safety standard set forth at 29 CFR 1926.28(a).

5. The violation was "serious" within the meaning of the Act.

6. The penalty assessed below is reasonable and appropriate in light of the criteria shown in section 17(j) of the Act (29 USC sec. 666(i)).

ORDER

Upon the basis of the foregoing findings of fact, conclusions of law, and the record as a whole, it is ORDERED that:

1. The citation is AFFIRMED.

2. A civil penalty of $550 is assessed.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>BORTON, INC.,<br><br>Respondent. | OSHRC Docket No. 77-2115 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge David G. Oringer is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Oringer vacated one item of a serious citation issued to Respondent Borton, Inc. ("Borton"), that alleged a failure to comply with the standard contained at 29 C.F.R. § 1926.451(a)(13). Section 1926.451 is entitled "scaffolding" and provides in subsection (a)(13) that "[a]n access ladder or equivalent safe access shall be provided." The Secretary of Labor ("the Secretary") petitioned for review of the judge's decision. Commissioner Cottine granted the Secretary's petition. Pursuant to the direction of Commissioner Cottine, review was to be limited to the following issue:

> Whether the Respondent established an affirmative defense by showing that the employee's failure to use the provided access ladder constituted unpreventable employee misconduct.

I

Borton is a contractor involved in the construction of grain silos or tanks. During the construction of a silo at the Tensas Port Elevator in St. Joseph,

Louisiana, one of Borton's employees, Calvin Williams, fell to his death. At the time, Borton's employees were in the process of removing forms near the top of the inside of the silo. In order to accomplish this task, one of the employees had been assigned to install a scaffold within the tank. The completed scaffold was located approximately seven feet from the top of the silo and approximately 123 feet above the floor of the structure. Employees gained access to the scaffold through a hatch at the top of the silo.

Prior to his fall, Williams was on top of the silo waiting for a co-worker to complete the scaffold. He was equipped with a safety belt and had tied off his safety lanyard at a point approximately seven feet from the access hatch. When his co-worker completed the scaffold and emerged from the silo, Williams proceeded to the hatch. Although Williams was not seen entering the silo, it is undisputed that he did not use a ladder to descend to the scaffold. It appears that he descended to the scaffold either by lowering himself with his safety lanyard or by supporting himself in the hatch opening and dropping to the scaffold. When Williams landed on the scaffold, one of the scaffold planks broke, and he fell through the scaffold to the floor of the silo, 123 feet below, suffering fatal injuries. 1/

John L. Benton, a deputy sheriff in the Tensas Parish sheriff's office, arrived at the accident scene about fifteen minutes after the accident occurred and conducted an investigation. He was told by Ray Powell, Williams' foreman, who had been on top of the silo when Williams entered the hatch, that Williams previously had been reprimanded several times for failing to use a ladder when

---

1/ During the fall, Williams' safety lanyard, which was about 36 feet long, broke. Following an investigation, the Secretary cited Borton for a violation of the standard set forth at 29 C.F.R. § 1926.104(d). The standard requires, in pertinent part, that the maximum length of a safety belt lanyard shall permit a fall of no greater than 6 feet. Before Judge Oringer, Borton argued that Williams' use of an excessively long safety lanyard was in violation of Borton's work rule, which limited the length of a lanyard to 20 feet. The judge rejected this argument and found Borton in serious violation of § 1926.104(d). Borton did not petition for review of this aspect of the judge's decision, and review was not directed on this issue.

entering silos. 2/

Donald Billmeier, Borton's superintendent at the worksite, testified that the employees "were supposed to use a ladder" to gain access to the scaffold and that Williams' failure to do so was contrary to this rule. When asked how else employees could reach the scaffold, he replied: "We usually let them down. They can let theirselves down." He then denied that this was the method ordinarily used by employees. As to the method used to return from the scaffold to the silo roof, Billmeier explained: "[M]y procedure is to make them use a ladder, but sometimes they lift each other out." According to Billmeier, if employees fail to use a ladder, "[We] just raise hell with them and tell them either to use it...or hit the road." Billmeier was not aware that Williams had been reprimanded for violations of Borton's work rule requiring the use of ladders, nor was Billmeier present on the top of the silo on the day of the accident.

Borton's safety director, Joe Keating, inspected the work site on the day after Williams fell. According to Keating, he observed an aluminum ladder on top of an adjacent silo approximately 25 to 30 feet from the silo where Williams fell. Keating testified that Borton's instruction to employees working from completed scaffolds inside silos was to use a ladder when entering the silo. In addition, he testified that it was not possible to use ladders when constructing scaffolds because there was no stable place to locate the ladder. Employees who failed to follow instructions were reprimanded or discharged. Keating noted that, in view of the job superintendent's other duties, enforcement of safety rules was partially delegated to the foremen at the worksite. Keating was unaware that Williams had been reprimanded for past failures to use a ladder when entering a silo. Keating

---

2/ Foreman Powell and two other persons who worked on the top of the silo on the day of the accident were subpoenaed by the Secretary but failed to appear at the hearing. At the time of the hearing, seven-and-a-half months after the accident, Powell was no longer employed by Borton and his whereabouts was unknown.

also stated that he required regular safety meetings, but did not specify who attended the meetings or whether the work rule concerning use of ladders was discussed at these meetings.

II

Judge Oringer found that Borton met the standard's requirement of providing a ladder at the silo. The judge further reasoned that, in addition to providing a ladder, an employer "should attempt to insure that the ladder is used by the employees for the purpose intended." In this regard, the judge found that Borton instructed employees to use ladders and disciplined noncomplying employees. The judge further found that Williams was an experienced employee and that, in view of his experience, Borton was not required to provide "one to one supervision" to ensure that he used the ladder which had been provided. Judge Oringer therefore vacated the part of the citation alleging a serious violation of section 1926.451(a)(13).

III

On review the Secretary argues that Borton's affirmative defense should be rejected and that the judge's decision should be reversed since Borton failed to ensure, through the application of effective disciplinary measures, that its employees used the provided ladder. The Secretary contends that, in view of Williams' history of noncompliance with Borton's work rules, more effective discipline and closer supervision were required to promote compliance.

Borton did not address the issue of its affirmative defense of unpreventable employee misconduct in its brief on review. Instead, Borton contends that the judge's decision should be affirmed since a ladder was provided at the worksite on the day of the accident. According to Borton, section 1926.451(a)(13) by its terms requires that a ladder be "provided" and does not require an employer to ensure use of ladders. Borton further submits that this matter is controlled by the Tenth Circuit's decision in Usery v. Kennecott Copper Corp., 577 F.2d 1113

(10th Cir. 1977), in which the court, interpreting an identically-worded general industry standard set forth at 29 C.F.R. § 1910.28(a)(12), held that an employer must provide, but need not ensure use of, ladders in order to comply with the standard.

IV

Following the issuance of the judge's decision, the Commission held in Ray Boyd Plaster & Tile, Inc., 78 OSAHRC 47/D8, 6 BNA OSHC 1648, 1978 CCH OSHD ¶ 22,794 (No. 76-814, 1978) ("Ray Boyd"), that the standard at section 1926.451(a)(13) requires that ladders must be used, not merely supplied. In that decision, Commissioner Cleary reasoned that a standard that requires an employer to provide a safety device implicity requires the device to be used. We adhere to the holding of Ray Boyd and adopt Commissioner Cleary's rationale. 3/

The Occupational Safety and Health Act was enacted to "assure so far as possible every working man and woman in the nation safe and healthful working conditions." 29 U.S.C. § 651(b). In keeping with its broad remedial purpose, the terms of the Act and regulations promulgated under it are to be construed liberally. Whirlpool Corp. v. Marshall, 445 U.S. 1 (1980); Bristol Steel & Iron Works, Inc. v. OSHRC, 601 F.2d 717 (4th Cir. 1979); Brennan v. OSHRC (Gerosa, Inc.), 491 F.2d 1340, (2d Cir. 1974). The objective of the standard contained at section 1926.451(a)(13) is to provide employees with safe access to scaffolding by means of a ladder or equivalent device. This objective cannot be achieved if an employer

---

3/ In Ray Boyd former Commissioner Barnako also concluded that a use requirement was implicit in § 1926.451(a)(13), but for a different reason. In his view, the standard contained at § 1926.451(a)(13) must be read together with § 1926.450(a)(1), which states: "Except where either permanent or temporary stairways or suitable ramps or runways are provided, ladders described in this subpart shall be used to give safe access to all elevations." (emphasis added) He thus found a "use" requirement to be implicit in § 1926.451(a)(13). Commissioner Cottine agrees that § 1926.450(a)(1) constitutes an additional basis for his conclusion that § 1926.451(a)(13) requires use of an access ladder or equivalent safe access.

is required merely to provide a ladder that may or may not be used by employees to gain access to scaffolding. Final responsibility for occupational safety and health rests with the employer. To read this standard narrowly to require employers to provide a ladder or an equivalent device, but not to require that employers ensure use of such equipment, would improperly shift responsibility for occupational safety and health from the employer to the employee. See Hillsdale Lumber & Manufacturing, Inc., 77 OSAHRC 54/D2, 5 BNA OSHC 1281, 1977-78 CCH OSHD ¶ 21,766 (No. 5815, 1977) (Cleary, dissenting). Accordingly, under section 1926.451(a)(13), an employer must not only provide but also ensure the use of an "access ladder or equivalent safe access" when employees seek to gain access to scaffolding.

We do not agree with Borton's contention that the court of appeals' decision in Usery v. Kennecott Copper Corp., supra ("Kennecott"), controls this case. In Kennecott, the Tenth Circuit affirmed the decision of a divided Commission that the general industry standard contained at 29 C.F.R. § 1910.28(a)(12) did not impose a use requirement. Commissioner Cleary dissented in that case. There, as here, he reasoned that a standard that requires an employer to provide a safety device implicitly requires that the device be used. Kennecott Copper Corp., 76 OSAHRC 81/A2, 4 BNA OSHC 1400, 1976-77 CCH OSHD ¶ 20,860 (No. 5958, 1976) (Cleary, dissenting). As indicated above, we agree with this view. We no longer adhere to the Commission's decision in Kennecott and decline to follow the view of the Tenth Circuit in that case because those decisions failed to construe the word "provide" broadly and remedially in accordance with the purpose of the Act. 4/ See Brennan v. OSHRC (Gerosa, Inc.), supra.

---

4/ We also note that the general industry standards contained no counterpart to § 1926.450(a)(1), and Kennecott is therefore distinguishable from this case, which concerns construction industry standards.

We agree with the judge's finding that Borton provided a ladder at the worksite in question. However, based on the uncontroverted evidence that Williams did not use a ladder to gain access to the scaffold, we find that a violation of the standard at § 1926.451(a)(13) was established. Additionally, we do not find that Williams' failure to use the ladder constituted unpreventable employee misconduct.

In order to defend successfully against a citation on the grounds that a violation of the Act arose from unpreventable employee misconduct, an employer must establish that the action of its employee was a departure from a uniformly and effectively communicated and enforced work rule. H. B. Zachry Co., 80 OSAHRC 9/D8, 7 BNA OSHC 2202, 1980 CCH OSHD ¶24,196 (No. 76-1393, 1980), aff'd, 638 F.2d 812 (5th Cir. 1981).

Although Borton adopted a work rule intended to prevent the violation in question, the rule apparently was not in writing and it is unclear if the rule was effectively communicated to employees. Moreover, Williams violated this rule several times and Borton took no action beyond oral reprimands to compel compliance. Additionally, although Billmeier and Keating testified that employees who violated work rules were reprimanded or discharged, there was no evidence of these measures being taken in any specific instance other than the reprimands given to Williams. As the Commission stated in B. G. Maintenance Management, Inc., 76 OSAHRC 60/A2, 4 BNA OSHC 1282, 1284, 1976-77 CCH OSHD ¶20,744 at p. 24,881 (No. 4713, 1976), an employer must make "a diligent effort to discourage, by discipline if necessary, violations of safety rules by employees." Moreover, Billmeier testified that employees sometimes did not use a ladder to move from the scaffold to the silo roof. Additionally, his testimony concerning whether employees used ladders to reach scaffolds in silos was equivocal. Thus, it appears that employees did not uniformly use ladders when rules required them to do so. We therefore agree with the Secretary that Borton's work rule requiring use of ladders was not effectively

enforced. Daniel International Corp., Brown & Williamson Project, 81 OSAHRC 57/A2, 9 BNA OSHC 1980, 1981 CCH OSHD ¶ 25,492 (No. 15690, 1981) pet. for review docketed, No. 81-7602 (5th Cir. July 21, 1981).

We also disagree with the judge's conclusion that Borton was not required to closely supervise Williams because he was an experienced employee. We find no evidence that Williams was experienced. In any event, the fact that an employee is experienced does not relieve an employer from responsibility for affirmatively enforcing its safety rules. Cornell & Co., 77 OSAHRC 164/F5, 5 BNA OSHC 1736, 1977-78 CCH OSHD ¶22,095 (No. 8721, 1977); Taylor Building Associates, 77 OSAHRC 27/A10, 5 BNA OSHC 1083, 1977-78 CCH OSHD 21,592 (No. 3735, 1977). The level of supervision that an employer must provide must be determined by the facts in each case. Lebanon Lumber Co., 73 OSAHRC 10/A2, 1 BNA OSHC 1165, 1971-73 CCH OSHD ¶15,530 (No. 184, 1973). On the day of his fall, Williams violated Borton's workrules not only by entering the silo without using a ladder but also by wearing an excessively long safety lanyard. 5/ Moreover, according to superintendent Billmeier, employees sometimes failed to use a ladder when moving from the scaffold to the silo roof. This lax supervision of safety matters buttresses our conclusion that Borton's workrules were not effectively enforced.

In view of Borton's failure to show that it adequately enforced its safety rules through effective discipline and supervision, we conclude that Borton has failed to establish its affirmative defense of unpreventable employee misconduct and that a violation of section 1926.451(a)(13) must be affirmed.

We further conclude that the Secretary properly characterized the violation

---

5/ Although not before us on review, Borton's violation of § 1926.104(d) is relevant to the effectiveness of Borton's safety program. See Jensen Constr. Co., 79 OSAHRC 49/D3, 7 BNA OSHC 1477, 1479 n. 5, 1979 CCH OSHC ¶23,664 at p. 28,695 n. 5 (No. 76-1538, 1979).

in question as serious within the meaning of section 17(k) of the Act. 6/ A fall of approximately 123 feet obviously could and, in this case, did result in an employee's death. Before his fall, Williams had been reprimanded several times for failing to observe Borton's work rule requiring employees to use a ladder when entering a silo. Borton's superintendent also acknowledged that employees sometimes failed to use ladders when emerging from interior scaffolds to gain access to the silo roof. In view of these facts, we find that Borton knew or, with the exercise of reasonable diligence, could have known of its employee's practice of noncompliance with this workrule. Niagara Mohawk Power Corp., 79 OSAHRC 36/A2, 7 BNA OSHC 1447, 1979 CCH OSHD ¶23,670 (No. 76-2414, 1979). Accordingly, we conclude that Borton's violation of section 1926.451(a)(15) was serious.

V

The Secretary proposed a $350 penalty for Borton's violation of the cited standard. We now turn to section 17(j) of the Act to determine an appropriate penalty. 7/ In view of the resulting fatality of Borton's employee, the gravity of the violation is high. Borton exhibited some good faith by conducting safety

---

6/ Section 17(k), 29 U.S.C. § 666(j), provides:

> For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

7/ Section 17(j), 29 U.S.C. § 666(i), provides:

> The Commission shall have authority to assess all civil penalties provided in this section, giving due consideration to the appropriateness of the penalty with respect to the size of the business of the employer being charged, the gravity of the violation, the good faith of the employer, and the history of previous violations.

meetings and establishing work rules, and there is no evidence that Borton has been cited for prior violations of the Act. In balance, we conclude that the proposed penalty of $350 is appropriate.

Accordingly, we reverse the judge's decision and affirm a serious violation of the Act for Borton's violation of the standard contained at section 1926.451 (a)(13). A $350 penalty is assessed.

SO ORDERED.

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: MAR 31 1982

ROWLAND, Chairman, dissenting:

I dissent from the majority's conclusion that Borton failed to comply with 29 C.F.R. § 1926.451(a)(13) because its employees did not use a ladder for access to the scaffold. In my view, the standard by its plain terms imposes only the obligation that the employer provide a ladder or other means of access to a scaffold. I would not follow Ray Boyd Plaster & Tile, Inc., 78 OSAHRC 47/D8, 6 BNA OSHC 1648, 1978 CCH OSHD ¶ 22,794 (No. 76-814, 1978), in which the Commission held to the contrary, for I find that case wrongly decided. Since there is no dispute that Borton in fact provided an access ladder to the scaffold in question, it is in compliance with the requirements of section 1926.451(a)(13).

In this case the majority adopts the view previously expressed individually by Commissioner Cleary in Ray Boyd, supra, that the term "provided" as it appears in section 1926.451(a)(13) implicitly requires that ladders be used as well. Commissioner Cottine also interprets this standard to impose a use requirement for the reason stated by former Commissioner Barnako. That is, Commissioner Cottine additionally concludes that section 1926.451(a)(13) must be read together with section 1926.450(a)(1), which requires that ladders "be used" to give safe access to "elevations." 8/ I disagree with both the majority's interpretation of the term "provided" and Commissioner Cottine's view that sections 1926.451(a)(13) and 1926.450(a)(1) are to be read together.

---

8/ I note, however, that it is not entirely clear from the majority opinion whether former Commissioner Barnako's view is adopted only by Commissioner Cottine. Although only Commissioner Cottine expressly agrees with former Commissioner Barnako's view that sections 1926.451(a)(13) and 1926.450(a)(1) are to be read together, both Commissioner Cleary and Commissioner Cottine would distinguish Usery v. Kennecott Copper Corp., 577 F.2d 1113 (10th Cir. 1977), on the basis that no equivalent to section 1926.450(a)(1) existed in the standards at issue in that case. To this extent, therefore, it appears that the majority considers the requirements of section 1926.450(a)(1) to be relevant in the disposition of this case.

(Continued)

Regardless of whether, as the majority asserts, standards are to be construed liberally to effectuate the purposes of the Act, it is equally true that the purposes of the Act are not served unless employers have fair notice of their obligations under the standards. Therefore, a standard cannot be construed to mean what the promulgating agency may have intended but did not adequately express. 9/ Bethlehem Steel Corp. v. OSHRC, 573 F.2d 157 (3rd Cir. 1978); Usery v. Kennecott Copper Corp., 577 F.2d 1113 (10th Cir. 1977); Diamond Roofing Co. v. OSHRC, 528 F.2d 645 (5th Cir. 1976). See the discussion in Bethlehem Steel, supra:

> The purpose of OSHA standards is to improve the safety conditions in the working place, by telling employers just what they are required to do in order to prevent or minimize danger to employees. In an adjudicatory proceeding, the Commission should not strain the plain and natural meaning of words in a standard . . . . The responsibility to promulgate clear and unambiguous standards is upon the Secretary.
>
> 573 F.2d at 161.

---

8/ (Continued)

As explained infra, I do not agree that it is appropriate in this case to refer to section 1926.450(a)(1) in interpreting the meaning of section 1926.451(a)(13). Therefore, I do not join in the majority's conclusion that Kennecott Copper, supra, is distinguishable.

9/ Furthermore, none of the authorities cited by the majority in support of the proposition that the Act and the standards are to be liberally construed apply that rule of construction to interpret a standard in a manner contrary to its plain meaning. Indeed, neither Whirlpool Corp. v. Marshall, 455 U.S. 1 (1980), nor Bristol Steel & Iron Works, Inc. v. OSHRC, 601 F.2d 717 (4th Cir. 1979), are even relevant to the issue of interpretation presented in this case. In the former case, the Supreme Court was asked to consider whether a regulation permitting employees to refuse to work under certain conditions was within the Secretary's authority under the Act. In the latter case, the question was whether a general standard requiring that employees be protected from hazards was applicable to employers engaged in steel erection in view of the specific safety standreds promulgated by the Secretary for the industry. Only the court in Brennan v. OSHRC (Gerosa, Inc.), 491 F.2d 1340 (2d Cir. 1974) considered the

(Continued)

As the court properly noted in Kennecott Copper, supra, the word "provide" is not ambiguous. Rather, the term has a plain meaning; it is commonly understood to mean "furnish," "supply," or "make available." The term is not normally understood to refer to "use" as a separate and distinct obligation, nor does its dictionary definition state any such connotation. 10/ Therefore, while a reasonable employer would recognize an obligation under section 1926.451(a)(13) to make a ladder or other means of access available for use by employees, he would not interpret the standard to impose any further requirement.

Similarly, an employer cannot reasonably be expected to refer to other standards to apply to "provide" a meaning contrary to that term as commonly understood. 11/ Admittedly, standards written in broad terms

---

9/ (Continued)

meaning of a particular term as used in a standard. The issue before the court was the proper interpretation of a standard requiring that the employer "designate" an inspector for cranes and derricks. Although the court noted as a general principle that regulations must be construed so as to effectuate congressional objectives, it relied in part on a conclusion that the ordinary meaning of the term "designate" was consistent with the interpretation the Secretary sought to apply.

10/ Webster's Third New International Dictionary (1971) lists the following definitions for "provide": To take precautionary measures, make provision; to supply what is needed for sustenance or support; to fit out or fit up, equip; to supply for use. "Supply" and "furnish" are listed as synonyms.

11/ Commissioner Barnako's opinion to the contrary in Ray Boyd, supra, also relied in part on Turnbull Millwork Co., 77 OSAHRC 205/C8, 6 BNA OSHC 1148, 1977-78 CCH OSHD ¶ 22,388 (No. 15047, 1977). That case, however, is inapposite since it involved the question whether under a woodworking machine standard the use of combs or jigs was required by the language "[c]ombs (featherboards) or suitable jigs shall be provided . . . for use when a standard guard cannot be used. . . ." The Commission held that a use requirement was imposed since the standard intended by its plain wording that there be no gap in employee protection when standard guards cannot be used. The question in this case, however, is whether a standard which does not at all mention use may have a use requirement read in from a totally different standard.

which would otherwise be vague may be limited in scope by reference to other relevant standards. Modern Automotive Service, 74 OSAHRC 9/A11, 1 BNA OSHC 1544, 1973-74 CCH OSHD ¶ 17,369 (No. 1541, 1974). See H.E. Wiese, Inc., No. 78-204 (March 31, 1982) (dissenting opinion). However, there is no authority for the proposition that standards written in specific terms which are clear on their face must be interpreted in this manner. 12/ Rather, the use of obviously different terminology within the Secretary's standards is evidence of an intentional differentiation. See Lankford v. LEAA, 620 F.2d 35 (4th Cir. 1980); United States v. Wong Kim Bo, 472 F.2d 720 (5th Cir. 1972). Indeed, the plain distinction between "provided" and "used" is supported by other standards which are expressly directed to the matter of employee use of equipment furnished by the employer. These standards demonstrate that when the Secretary intends to require that employees use such equipment, he consistently employs language which explicitly states that intention.

For example, section 1926.28(a), which is entitled "personal protective equipment," specifically states that the employer must require employees to use such equipment: "The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees." Other standards which do not expressly impose a duty on the employer to require certain conduct by employees nevertheless use language indicating that

---

12/ In H.E. Wiese, Inc., No. 78-204 (March 31, 1982) I stated my view that in determining the meaning of the phrase "equivalent safe access" as used in section 1926.451(a)(13) it is appropriate to look to the specifications for ladders set forth in section 1926.450. That conclusion, however, was based on the premise that otherwise the term "equivalent safe access" could be vague. As explained supra, it is not necessary to refer to other standards in order to define "provided" since the meaning of that term is clear on its face.

the standards are directed to employee conduct. Section 1926.451(i)(8) uses the term "permitted" with reference to the number of employees who may work on a suspension scaffold at any one time. This standard also addresses the employer's duty in terms of a specific level of employee safety which must be achieved: "[e]ach employee shall be protected by an approved safety life belt attached to a lifeline." Clearly, the Secretary has deliberately differentiated those situations in which employers need only provide equipment from those situations in which an additional duty with respect to the actions of employees is imposed on the employer.

On the other hand, it is equally plain that the standards imposing an additional obligation on the employer beyond merely the provision of safety equipment are written in general terms which do not precisely delineate the scope of the employer's duty. The Act, however, does not make an employer the insurer of his employees' safety. Kennecott Copper, supra, 577 F.2d at 1118 (citing cases). As the Second Circuit has observed in discussing the breadth of a general industry standard, section 1910.133(a)(1), which states that eye and face protection "shall be required" and that employees "shall use" such equipment, "[i]f employers are to be held to an obligation requiring something more than instructing employees to use protective equipment but something less than guaranteeing use, the promulgation of a standard fleshing out the employer's obligation would provide useful guidance to employers, the Commission, and reviewing courts." General Electric Co. v. OSHRC, 540 F.2d 67, 69 (2d Cir. 1976).

I share the concern of the Second Circuit that the extent of the efforts employers must make to insure that employees use safety equipment be clearly expressed. Therefore, while I am not unmindful of the serious safety hazard existing on the facts of this case, I cannot conclude that Borton did not satisfy its duty to its employees absent evidence to show that Borton failed

to take the appropriate steps to protect its employees from the hazard. Although I believe that Borton complied with the strict terms of section 1926.451(a)(13) by merely furnishing a ladder for its employees to use, I note that Borton also instituted a work rule requiring that employees use the ladder and attempted to enforce this rule by reprimanding or discharging employees. Even if the term "provided" in section 1926.451(a)(13) may properly be interpreted, as the majority concludes, to refer to employee use of a ladder as well as to its availability, the standard would not give notice that Borton needed to make any further efforts to insure that its employees used the ladder which it provided. Therefore, I cannot join in the majority's conclusion that Borton failed to enforce its work rule "effectively" since the evidence presented regarding the adequacy of Borton's safety program shows only that Borton has not been able to prevent every instance of employee noncompliance with the work rule. 10/ Neither the Act nor the standard as interpreted by the majority can properly be said to impose such a stringent obligation on the employer.

Since I would find Borton's conduct reasonable in the circumstances regardless of how section 1926.451(a)(13) is interpreted, I would vacate the citation alleging a violation of that standard.

---

10/ For the same reason, I do not agree with the majority that Borton's violation of section 1926.104(d) also demonstrates the lack of effectiveness of its safety program. It is not clear whether the majority is referring to the deceased employee's violation of Borton's rule requiring that the lanyard be no more than 20 feet in length or to the requirement of section 1926.104(d) regarding the maximum length of a lanyard. Insofar as Borton's enforcement of its lanyard rule is concerned, there is no evidence that the deceased or any other employee had ever previously used a lanyard in excess of 20 feet in length. With regard to the requirements of section 1926.104(d), employees could secure their lanyards at any number of locations on the structure, which had a diameter of 26 feet. Other than the circumstances surrounding the fatality in question, there is no evidence that any employee including Williams had ever tied off his lanyard at such a point as to expose himself to a fall of more than six feet.

Hutchinson, Kansas 67501

## DECISION AND ORDER

ORINGER, JUDGE: This is a proceeding under section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651, et seq., (hereinafter referred to as the"Act") to review a citation issued by the Secretary of Labor (hereinafter referred to as "Complainant") pursuant to section 9(a) and, a proposed assessment of penalties thereon issued, pursuant to section 10(a) of the Act. The Secretary issued a citation to the

respondent subsequent to an inspection of its worksite on June 8 and 9, 1977, alleging "serious" violations of the standards set forth at 29 C.F.R. 1926.104(d) and 29 C.F.R. 1926.451(a)(13) and proposed penalties in the amounts of $420 and $350, respectively, for the aforesaid alleged violations. The respondent filed a timely notice of contest contesting the citation with all of its items thereon as well as all of the proposed penalties.

The violations, as alleged by the complainant in his citation, are described as follows:

| STANDARD, REGULATION OR SECTION OF THE ACT ALLEGEDLY VIOLATED | DESCRIPTION OF ALLEGED VIOLATIONS |
|---|---|
| "The violations described in this citation are alleged to have occurred on or about the day the inspection was made unless otherwise indicated within the description given below." | |
| 1<br>29 C.F.R. 1926.104(d) | "Safety belt lanyard(s) worn by employee(s) were of a length that would provide for a fall greater than 6 feet:<br><br>(a) Tank #200-One employee with 15' lanyard & one employee with 34' lanyard.<br><br>(b) Tank #201-One employee with 15' lanyard & one employee with 20' lanyard.<br><br>This condition occurred on or about March 31, 1977." |
| 2<br>29 C.F.R. 1926.451(a)(13) | "An access ladder or equivalent safe access to scaffold(s) was not provided:<br><br>(a) Tank #200 & Tank #201-Five employees were required to drop approximately 7 feet through access opening of Tank #70 hanging scaffolds.<br><br>This condition occurred on or about March 31, 1977." |

Complaint and answer issued in the case and the cause came to trial on January 17, 1978, in Baton Rouge, Louisiana.

## THE ISSUES

1. Does the respondent's business affect commerce and is this cause within the jurisdiction of this tribunal?

2. Did the complainant prove that the respondent was in violation of the standard set forth at 29 C.F.R. 1926.104(d)?

3. Did the complainant prove that the respondent was in violation of the standard set forth at 29 C.F.R. 1926.451(a)(13)?

Having heard the testimony and observed the demeanor of the witnesses and having considered the same, together with the citation, notification of proposed penalty, notice of contest, pleadings, representations, stipulations and admissions of the parties, it is concluded that the preponderance of the credible evidence of record supports the following

## FINDINGS OF FACT

1. The respondent, Borton, Inc., does business and works in more than one state of the union (Tr. 4).

2. The respondent employs approximately 450 employees annually and has a gross annual volume of business approximately thirty to thirty-five million dollars (Tr. 4).

3. The scaffold from which the accident occurred in the instant cause was inside a concrete silo, one hundred thirty feet high, and approximately circular with a twenty-six foot diameter constructed of concrete and two steel beams with a top to the silo. The scaffold is underneath the top surface of the silo and to get onto the scaffold, the employees must go down to an access hatch (Tr. 9, 10).

4. The scaffold was seven feet below the hatch opening (Tr. 10).

5. The scaffold concerned herein consisted of cables and 2 by 6's, three-ply, nailed toegether hanging down about seven-foot below the entrance into the access hatch and had 2 by 10's laid across and nailed on each end (Tr. 10). The employees were working on and from the scaffold removing forms from the interior of the structure. Ordinarily, the employees got from the opening at the access hatch onto the scaffold by ladder (Tr. 13).

6. Once the employees reach the scaffold, they tie on with safety belts onto a toggle on the ceiling (Tr. 14).

7. The employees normally tie off before they go in through the access hatch (Tr. 14). The reason for having the men tie off outside the access hatch is so that in the event of some traumatic emergency, fellow workers can get ahold of the rope and remove the employee from the scaffold Tr. 16).

The accident complained of herein was the falling of an employee from the scaffold to the concrete floor, one hundred thirty feet below. The accident occurred when his safety rope broke and one of the 2 by 10's was knocked out and missing (Tr. 28, 29).

8. The foreman on top was one, Roy Powell (Tr. 31). The construction superintendent, Mr. Billmeier, instructs his employees that the length of the lanyard should be 20 feet (Tr. 32). The superintendent had disciplined employees for failing to use a ladder to get down onto the scaffold (Tr. 37).

9. The deceased employee was wearing a safety harness and at the time that he was found on the ground had a broken safety line. The deceased was lying on the board that apparently broke off the scaffold platform (Tr. 40, 41).

10. Prior to going into the tank, the deceased asked when he could come into and get on the platform so as to go to work and was advised that it was not quite finished yet and he had to wait awhile (Tr. 42). There was no ladder observed near the opening by the officer who responded to the accident call (Tr. 42). The line that was worn by the deceased, while he was working, was almost thirty-six and a half feet long (Tr. 44, 45).

11. The deceased had to lower himself or jump seven feet to get onto the scaffold so he had approximately twenty-nine feet of slack rope attached (Tr. 45, 46).

12. A test was made by dropping weight identical to that of the deceased and the line of the same length when dropped with the weight also broke (Tr. 46).

13. The deceased had failed to use a ladder several times previously and therefore had been in violation of the superintendent's orders and the respondent's rules. As a result thereof, he had been verbally reprimanded (Tr. 47). The board that broke under the weight of the deceased was not defective and it appeared to be something that you could use on a platform (Tr. 48).

14. The use of the ladder to get onto the scaffold would be perfectly safe (Tr. 51). The government did not allege in the instant cause that the lanyard was not as thick as it should be and did not argue that it did not have the normal breaking strength of 5400 pounds (Tr. 54, 55). The breaking

strength of the rope furnished the employees is about 11,000 pounds per square inch (PSI). It is a a three-quarter inch polypropylene rope (Tr. 57).

15. At this installation, the respondent provided a twelve-foot long aluminum ladder (Tr. 58).

16. The twelve-foot aluminum ladder was located to the south and west of the access opening about a tank away approximately 25 to 30 feet from the access entry involved herein (Tr. 62, 63).

17. The thirty-six foot lanyard used by the deceased was in violation of company policy. However, neither the job superintendent nor the foreman either observed or stopped the deceased from wearing the rope (Tr. 63, entire record).

18. After the employees reached the scaffold, the ladder was removed so that the employees could work inside the silo (Tr. 66).

## OPINION

Taking the allegations of violation in inverse order, the Secretary charged this respondent with a violation of the standard set forth at 29 C.F.R. 1926.451(a)(13) which requires that an access ladder or equivalent safe access shall be provided as a general requirement for scaffolding. The evidence of record convinces me that the respondent provided a twelve foot aluminum ladder at the job site that was, at the time of the accident, some 25 to 30 feet from the access entry to the scaffold. The question remains whether or not the employer or its representative should have been aware that this employee did not have the ladder poised at the proper place for entry into the silo wherein the scaffold was located. In my opinion, the standard calls for the providing of a ladder. The employer did provide it and

while there is some doubt in my mind concerning the foreman's assurance that the ladder was used for the purpose intended, in my opinion, the doubt here must be resolved in favor of the respondent. In addition to providing the ladder, the respondent should attempt to insure that the ladder is used by the employees for the purpose intended. In this case, the superintendent testified, and I believe, that he insisted that the ladder be used and disciplined men for not using it. It is questionable whether or not the foreman should have ascertained whether the deceased employee was using the ladder that was provided. However, the Commission has laid down an axiom that where an experienced employee is concerned, the employer need not exercise one to one supervision over such employee. The Commission stated "such a holding by the Commission, requiring that each employee be constantly watched by a supervisor, would be totally impracticable and, in all but the most unusual circumstances, an unnecessary burden." Secretary v. Canrad Precision Industries, Inc., Hanovia Lamp Division, 75 OSAHRC 61/E6 (2/55), 3 BNA OSHC 1198; 1971-73 CCH OSHD 15,355 (Docket No. 89). Accordingly, in my opinion, this item of the citation must be vacated.

Insofar as the allegation of violation of the standard set forth at 29 C.F.R. 1926.104(d) is concerned, I find that the Secretary has amply proven his case. In this case, the employer normally and usually allowed a twenty-foot lanyard to be used regardless of whether or not there was more than six feet of slack. The standard mandates that a safety belt lanyard shall have a maximum length to provide for a fall of no greater than six feet. In the event that fourteen feet was not being used, the fall could well be more than six feet. In any case,the deceased employee was using a lanyard approximately thirty-six and a half feet. This almost doubled the length

required by the respondent and certainly should have been ascertained by either the construction superintendent or the foreman. Certainly, the foreman was aware that the deceased was awaiting entry and had contact with him on the day in question. The lanyard was so atypical and so different and so much greater that failure to ascertain its deviation from the normal, in my opinion, was negligent supervision by the respondent's supervisory personnel. I find this a different matter than the ladder which was after all provided for the employees and would have taken a short walk to acquire. Here, it did not take close supervision to be aware that the lanyard was almost twice the length of that of any other employee on the job. In my opinion, the supervisor should have been doubly aware inasmuch as this employee had been disciplined for violating company safety regulations on previous occasions. Accordingly, I find the allegation of violation of this standard amply proven by the secretary.

Insofar as the proposed penalty is concerned, I find that the Secretary took into consideration all of the elements of section 17(j) of the Act. Inasmuch as the penalty for the standard set forth at 29 C.F.R. 1926.104(d) is concerned, I find it appropriate in the premises and rather moderate and mild. Insofar as the penalty proposed for the standard set forth at 29 C.F.R. 1926.451(a)(13) is concerned, I find a failure of proof of such violation by this respondent thus the penalty is inappropriate and must fall. The penalty, however, would have been appropriate and in consonance with all of the elements prescribed in section 17(j) of the Act, had the violation been, in fact, proven. In view of the fact I find it not proven, such penalty must fall.

Based on the aforementioned findings of fact and the above opinion the Judge makes the following

## CONCLUSIONS OF LAW

1. At all times herein mentioned, this respondent, Borton, Inc., was engaged in a business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970, and this Commission had jurisdication to hear and decide the within controversy.

2. The respondent, on the day of the accident herein complained of, was in violation of the standard set forth at 29 C.F.R. 1926.104(d).

3. The respondent, on the day of the accident herein complained of, was not in violation of the standard set forth at 29 C.F.R. 1926.451(a)(13).

4. The penalty proposed for the alleged violation of the standard set forth at 29 C.F.R. 1926.104(d) in the sum of $420 is appropriate in the premises and in consonance with all of the elements set forth in section 17(j) of the Act.

5. In view of the fact that the allegation of violation of the standard set forth at 29 C.F.R. 1926.451(a)(13) was found not proven, the penalty proposed therefor was inappropriate and must fall.

In view of the foregoing, good cause appearing therefor, it is ORDERED that:

1. The allegation that this respondent "seriously" violated the standard set forth at 29 C.F.R. 1926.104(d) is AFFIRMED and a penalty of $420 is ASSESSED therefor.

2. The allegation of violation of the standard set forth at 29 C.F.R. 1926.451(a)(13) by this respondent and the penalty proposed therefor in the sum of $350 are both herewith VACATED.

SO ORDERED this 17th day of April, 1978, in Atlanta, Georgia.

DAVID G. ORINGER, JUDGE, OSHRC

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

CLEARY, Commissioner:

A decision of Administrative Law Judge David G. Oringer is before the Commission under section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). These cases were consolidated before the hearing on the joint motion of both Respondents, H. E. Wiese, Inc. ("Wiese") and Industrial Electrical Construction Company ("Industrial"). Judge Oringer affirmed a citation against each Respondent alleging a serious violation of section 5(a)(2) of the Act, 29 U.S.C. § 654(a)(2), for failure to comply with the scaffold access safety standard at 29 C.F.R. § 1926.451(a)(13). 1/ The judge also found Wiese in serious violation of the Act for failure to comply

---

1/ 29 C.F.R. § 1926.451(a)(13) states:

> § 1926.451 Scaffolding.
> (a) General requirements.
> * * *
> (13) An access ladder or equivalent safe access shall be provided.

with the personal protective equipment standard at 29 C.F.R. § 1926.28(a), 2/ based on the exposure of employees of Wiese who worked without safety belts and lanyards at an unguarded elevation. The Secretary of Labor ("the Secretary") had alleged that the violation was repeated.

The Secretary and both Respondents petitioned for discretionary review of the judge's decision. I directed review on all of the issues raised by the petitions, including:

1. Whether the judge erred in concluding that Wiese failed to comply with 29 C.F.R. § 1926.28(a), and that the failure to comply constituted a "serious", but not a "repeated" violation of section 5(a)(2) of the Act?

2. Whether the judge erred in concluding that both respondents failed to comply with the standard at 29 C.F.R. § 1926.451(a)(13)?

The Commission affirms the judge's finding against both Respondents on the section 1926.451(a)(13) charge. However, the Commission reverses the judge's conclusion that Wiese violated the Act by failing to comply with section 1926.28(a) and we vacate the citation alleging that violation.

I

A

The citations now before us were issued as a result of an inspection conducted by compliance officer Don R. Welch of the Occupational Safety and Health Administration ("OSHA"). Both Respondents were engaged in the construction of a building at the inspected worksite for the Naptha Unit of Dow Chemical. The

2/ § 1926.28 Personal protective equipment.

(a) The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees.

citations alleging that Wiese and Industrial failed to comply with section 1926.451(a)(13) related to conditions located in the compressor deck area of the worksite. In this area, an overhead bridge crane spanned the width of the building under construction. Components of the crane included an elevated I-beam, a track (rails) on top of the beam, and a trolley (carriage) that moved back and forth along the track. At the time of the inspection, a scaffold was located on top of the trolley. The I-beam was approximately 20 feet above the compressor deck and 42 feet above the ground.

Compliance officer Welch testified that, as he returned from inspecting the electrical transformer that was the subject of an employee complaint, he observed two people working from the trolley scaffold installing lighting above the compressor deck. The only way to reach the scaffold was to climb a ladder that extended 20 feet from the deck to a 6-inch-wide sheet girder attached to a wall. Industrial's supervisors told the compliance officer that, from this girder, employees stepped across an unguarded 2-foot gap to the I-beam supporting the track, then climbed up the side of the trolley and over the scaffold guardrails onto the scaffold. The two persons observed on the scaffold were employees of Industrial. A third person, employed by another contractor (neither Industrial nor Wiese), told the compliance officer that he had been using the route described above on a regular basis to reach the scaffold, where he had worked as a millwright under Wiese's direction. On this basis, Industrial and Wiese were cited for allegedly violating the requirement of 29 C.F.R. § 1926.451(a)(13) that "[a]n access ladder or equivalent safe access" to scaffolds be provided. At the hearing, compliance officer Welch gave opinion testimony that the method of access used was unsafe because the 2-foot gap exposed employees to a fall of 20 feet to the concrete compressor deck or 42 feet to the ground. Welch further testified that the probable result of a fall through the gap would have been serious injury or death.

In addition the compliance officer testified that, in his opinion, a landing platform with guardrails could have been built and braced across the gap to provide safe access. This testimony was disputed by supervisors and safety managers for both Respondents who testified to conditions which they believed would have made it hazardous to build and use the access platform described by the compliance officer. One of the supports for this platform would necessarily have been the I-beam on which the bridge rail of the crane rested, and on which the crane's trolley and the scaffold traveled back and forth. However, the lower flange of the I-beam was approximately 12 to 14 inches lower than the sheet girder, which would have supported the other side of the platform. Accordingly, B.B. Ouber, Wiese's assistant superintendent, rejected the compliance officer's suggestion on the ground that the landing platform would be steeply slanted, thereby creating a greater risk of falling. Two other methods of constructing a landing platform were suggested. However, these were also rejected by Ouber because, although either method would result in a horizontal platform, both methods required welding. In Ouber's view, welding would weaken the crane and could result in the crane's collapse if it were operated at its full 55-ton capacity. Ouber also suggested the possibility that welding could create an explosion hazard. In addition, another witness, a vice-president of Industrial, asserted that a landing platform should not have been installed because employees would have been endangered while they were welding the platform.

Other possible access methods, and Respondents' objections to them, are also set forth in the record. For example, Ouber described an access route to the trolley temporarily used after the citations had been issued in these cases and after the trolley scaffold had been dismantled. This involved (1) ascending to a platform built on girders, (2) ascending from the platform by means of a

secured ladder to a catwalk, and (3) stepping directly through a hand railing on the catwalk onto the trolley. Ouber also testified, without contradiction, that this method could not have been used at the time of the inspection because it would have precluded trolley movement, which was then necessary in order to complete the installation of lighting. In addition, Ouber testified that prior to the inspection he considered the possibility of providing access by means of a moveable unsecured ladder rested against the catwalk. He noted, however, that the crane could not have been moved, and thus the work could not have been performed, with the ladder in this position. It therefore would have been necessary to remove the ladder after the employees had gained access to the scaffold. Accordingly, Ouber testified, this method of access was "disregarded" because employees would be left with "no way down" in the event of an injury or when they needed to get water or to use the bathroom.

B

Judge Oringer affirmed the alleged violation with respect to both Respondents. After entering findings on the means of access used to reach the scaffold, the judge further found, citing to the opinion testimony of the compliance officer, that "[e]mployees ascending to gain access to the scaffold were exposed to an open span of approximately two feet and thus were exposed to a fall of twenty feet to the concrete compressor deck which could bring about broken bones, concussions, contusions and possible death." Because "the area to which access was needed contained a hazard," the judge concluded that noncompliance with the cited standard had been proved. 3/ The judge also entered findings that two employees of Industrial and a third employee under Wiese's supervision had been exposed to the cited hazard.

---

3/ In the course of his discussion, the judge stated that, in his opinion, "the access provided and the access ladder comprised a hazard and when the standard requires that an access ladder shall be provided, it means a safe access ladder." (Emphasis supplied by the judge.)

With respect to the disputed issue of whether safe access could have been provided, the judge concluded that the testimony of the compliance officer was "logical." Based on this testimony, Judge Oringer found that "[t]he hazard could have been abated by utilizing a landing platform which could have been built and braced between the sheet girder and the lower flange on the crane rail." He further found that the violation was abated after the inspection. In addition, the judge rejected Respondents' argument "that the crane could not have been used without such an access hazard being present." He stated, "After reviewing all of the evidence, I do not agree."

On review, the Respondents contend that the judge misconstrued the requirements of the standard. They take exception to his statement that a "safe" access ladder must be provided, arguing that an access ladder was provided as required by the standard and therefore "[t]here was no need to consider an alternative equivalent safe access." They also assert that the ladder was the safest possible access to the scaffold. In addition, Respondents argue that the judge improperly interpreted the standard as requiring that an access ladder extend all the way to a scaffold. Alternatively, they suggest that, if the standard is given the meaning ascribed to it by the judge, then it is unenforceably vague because "[t]he only thing ascertainable from the cited standard is that an access ladder is needed."

Respondents also argue that the judge erred in finding that the hazard could have been abated by erecting a landing platform as suggested by the compliance officer. They assert that their witnesses established that there was no adequate method to secure a platform and that abatement after the inspection was only possible because there was no longer a need to have the crane move. In their view, a landing platform at the time of the inspection would have prevented the necessary movement of the trolley.

The Secretary argues in support of the judge's disposition.

C

At the outset, Commissioner Cottine and I reject the contention of Respondents that they complied with section 1926.451(a)(13) by providing an access ladder, notwithstanding the fact that the ladder in itself did not provide complete access to the scaffold in question. Respondents correctly argue that the standard does not require that an access ladder extend all the way to a scaffold. 4/ Nevertheless, the plain meaning of the standard is that safe access must be provided at all points between the lower elevation and the scaffold, whether by a ladder, by equivalent means, or by a combination of a ladder and other means. Here, Judge Oringer based his conclusion that Respondents failed to comply with section 1926.451(a)(13) on his finding that employees were exposed to a hazard at a point in their access route between the compressor deck and the scaffold. In arriving at this determination, the judge correctly interpreted the standard's requirements. 5/

The Commission recently upheld application of the same rationale to an alleged violation of the standard at section 1926.450(a)(1), requiring ladders or equivalent safe access to all elevations. In Steel Erectors, Inc., 81 OSAHRC 18/F1, 9 BNA OSHC 1399, 1981 CCH OSHD ¶ 25,228 (No. 77-1118, 1981), the Commission agreed with the judge's determination that the employer failed to prove its

---

4/ Respondents misconstrue the judge's decision as setting forth a contrary holding. We find no indication that the judge held that a ladder must extend all the way to the scaffold.

5/ Although the judge stated that the standard contains a requirement that any access ladder that is provided must be "safe," it is clear that his finding of noncompliance is based not on any defect in the existing ladder but on the hazard that was present between the top of the ladder and the scaffold. Because Respondents did not provide an access ladder between the 6-inch-wide sheet girder (the top of the existing ladder) and the scaffold, they were required to provide "equivalent safe access" through this last segment of the access route. This they did not do.

access methods provided safe access equivalent to the protection that would have been afforded by use of ladders. The employer in that case provided a stair tower to the elevation in question but employees were nevertheless exposed to a hazard when they crossed unguarded planks to reach the area where they performed their work. The facts in the case now before us are similar to those in Steel Erectors, Inc., and here, as in that case, the employer's defense was correctly rejected by the judge.

Respondents' argument that 29 C.F.R. § 1926.451(a)(13) is unenforceably vague has been rejected previously by the Commission in Ringland-Johnson, Inc., 76 OSAHRC 63/A2, 4 BNA OSHC 1343, 1346 n.11 [7], 1976-77 CCH OSHD ¶ 20,801 at p. 24,947 n.11 (No. 3028, 1976), aff'd, 551 F.2d 1117 (8th Cir. 1977), because in both "common and industry understanding, the words 'ladder' and 'equivalent' are not ambiguous and fairly apprise employers of the conduct required of them." See also, Deering Milliken, Inc., Unity Plant v. OSHRC & Marshall, 630 F.2d 1094, 1103 (5th Cir. 1980), quoting Ryder Truck Lines v. Brennan, 497 F.2d 230, 233 (5th Cir. 1974) ("So long as the mandate affords a reasonable warning of the proscribed conduct in light of common understanding and practices, it will pass . . . muster.") Neither is the phrase "safe access" unclear as it is used in the standard. An access route that includes one or more hazardous areas is not safe because employees will confront the hazard on their way to the scaffold's work surface. The fall hazard posed in these cases by the gap between girder and crane makes the access unsafe. Because neither a ladder nor its equivalent bridged this gap, the standard was contravened.

Respondents further object to the judge's finding that they could have abated the hazard by installing a landing platform. They cite testimony that, in their view, establishes that installation of the suggested platform, as well as the other alternatives considered at the hearing, was impossible. Specifi-

cally, they rely on testimony that welding the platform in place might weaken the structure and testimony that a ladder providing direct access to the work area would preclude operation of the crane trolley, particularly under the circumstances that existed on the day of the inspection.

An employer proves an affirmative defense of impossibility when it shows that (1) either compliance is physically impossible or it would preclude the performance of necessary work, and (2) there are no alternative ways to protect exposed employees. M.J. Lee Construction Co., 79 OSAHRC 12/A2, 7 BNA OSHC 1140, 1144, 1979 CCH OSHD ¶ 23,330 at p. 28,227 (No. 15094, 1979). We conclude that the Respondents have failed to sustain their burden of proof in these cases.

The judge rested his feasibility finding on testimony by the compliance officer that a landing platform could have been anchored to the girder and the crane's I-beam. 6/ Ouber, whose testimony is the basis of Respondents' challenge to the installation of a landing platform, conceded that it was possible to install a platform. In addition, there is no evidence that a landing platform would have prevented the movement of the crane trolley and thus the completion of the work in progress at the time of the inspection.

Similarly, Ouber conceded that employees could have reached the trolley directly by a ladder to the catwalk, so long as the ladder was not secured. If the ladder was removed whenever it was necessary to move the crane, it would not have interfered with the work. While it may have been inconvenient to remove

---

6/ We conclude that, although the judge found that the hazard was abated after the inspection, his finding that compliance was possible at the time of the inspection was based on the opinion testimony of the compliance officer and not on the fact of post-inspection abatement. We note that the method of abatement found feasible by the judge was the landing platform recommended by the compliance officer and not the method used after the inspection. Thus, we need not address the question of whether the post-inspection abatement method could have been used prior to the inspection.

and replace the ladder whenever employees needed access to or from the scaffold, mere difficulty or inconvenience of compliance is not a defense.

The testimony in opposition to the alternative of installing a landing platform was treated by the parties and the judge as raising the impossibility defense. However, the testimony of the witnesses as to their differing assessments of the relative safety of the various proposed methods of access squarely raises the issue in these cases as to whether abatement of the fall hazard by means of a landing platform or other suggested alternatives would have created an even greater hazard to employee safety.

To establish the greater hazard affirmative defense, the employer must show that: (1) compliance with a standard would create a hazard greater than that created by noncompliance, (2) alternative means of protecting the employees were either not available or used, and (3) an application for a variance would be inappropriate. Roofing Systems Consultants, 80 OSAHRC 51/C13, 8 BNA OSHC 1446, 1980 CCH OSHD ¶ 24,504 (No. 76-592, 1980); S & H Riggers & Erectors, Inc., 79 OSAHRC 23/A2, 7 BNA OSHC 1260, 1979 CCH OSHD ¶ 23,480 (No. 15855, 1979), rev'd on other grounds, 659 F.2d 1273 (5th Cir. 1981). We conclude that Respondents have also failed to meet this burden and therefore they have not established a greater hazard defense.

In our view, Respondents have not proved that any of three suggested alternatives would have created a hazard greater than that existing at the time of the inspection. We are not persuaded by Ouber's objection to the landing platform suggested by the compliance officer. Even if we agreed with his opinion that a slanted landing platform would have been more hazardous than the open gap, we nevertheless conclude that the platform would have been less hazardous than the cited conditions because of the protection that the guardrails on the platform would have provided. Similarly, we conclude that Respondents have not

established their assertion that a welded horizontal platform would have created a greater hazard. 7/ The opinion testimony of Ouber and of Industrial's vice-president as to the hazards that welding would create must be deemed speculative and unsupported. In particular, there is no explanation of the suggested explosion hazard or the asserted hazard to employees engaged in welding. Finally, we note that Respondent's only objection to the moveable ladder was that employees would be unable to get down from the scaffold when the ladder was removed. Yet there is no reason apparent in the record why the ladder could not have been placed back into position whenever it was needed to provide the necessary means of egress. For the reasons stated, Respondents have failed to meet their burden of proving any of their affirmative defenses. Commissioner Cottine and I affirm the judge's conclusion that Respondents violated the Act by failing to comply with 29 C.F.R. § 1926.451(a)(13).

II

A

The compliance officer testified that during his inspection he observed two of Wiese's employees working near the unguarded edge of a tube-and-coupler scaffold 60 feet above the ground. Neither employee was wearing a safety belt. Welch photographed the men, asked a supervisor to call them down, and then asked the employees whether they had safety belts. One of them stated that they did not. On this basis, the citation alleging noncompliance with 29 C.F.R. § 1926.28(a) was issued to Wiese. The citation further alleged that the violation was repeated.

One of the employees, William Earl Linder, testified that on the day of the inspection he and his co-worker had removed their safety belts after descending

---

7/ We note that there was no testimony that it would have been necessary to weld the slanted platform suggested by the compliance officer.

from the scaffold to get more building materials. On their return to the scaffold area, the belts were missing. Linder testified that they then located their foreman, Hall, and informed him of their lack of safety belts. In response, Hall requested belts from the Dow warehouse, but none was available. According to Linder, Hall then told the employees to continue their work and informed them that he would provide them with belts when belts became available at the warehouse. The employees therefore returned to the scaffold, where they were engaged in erecting guardrails when the compliance officer observed them. Linder further testified that he obeyed his supervisor because he thought he could do the work safely without a safety belt and also because disobedience to a supervisor was cause for dismissal. Hall, the foreman, did not testify.

In response to this showing by the Secretary, Wiese introduced extensive evidence as to its efforts to ensure the use of safety belts during the Naptha Unit construction project. At the time of the inspection J. A. Oliver was Wiese's general superintendent in charge of the construction work on the project. Both he and assistant superintendent Ouber, who was the safety officer for the job, testified that Wiese had an established policy concerning the use of safety belts on the project. According to Oliver, Wiese required any employee who had to work in a hazardous position to wear a safety belt. Moreover, Wiese's policy was communicated to employees; for example, through weekly meetings that everyone, including supervisors, was required to attend. At these safety meetings Ouber conducted safety talks, including lectures on the use of safety belts, and this subject was frequently discussed.

In addition, recurring safety inspections or "job site visits" were conducted by Herman Thompson, Wiese's manager of safety and security, with overall responsibility for safety matters in all work performed by either Wiese's construction division or its maintenance division, and Ouber. Thompson's reports of these

inspections, which apparently occurred approximately twice a month, show that he and Ouber consistently made a determination as to whether employees were using safety belts. Furthermore, when the inspectors observed employees without safety belts, the foremen were notified and instructions to use safety belts were issued. Indeed, Ouber testified that, whenever an employee was discovered without a safety belt when a belt was required, the employee was to be reprimanded and, if necessary, fired. Though the record does not indicate whether any employee had been terminated for failure to comply with the safety belt policy, Wiese did produce evidence that it issued reprimands to employees observed in violation of that policy. In addition, several termination slips introduced into evidence by Wiese show that employees were discharged for failure to comply with safety rules and failure to use required safety equipment other than safety belts.

Ouber further testified as to the standard procedure for obtaining safety belts, which were furnished by Wiese. An employee who needed a safety belt would go to his foreman, who would then go to the Dow warehouse and check out a belt. If there were no belts at the warehouse, the foreman was expected to search for belts and borrow them from workers who weren't using their belts.

Wiese's evidence, as set forth above, was corroborated by the testimony of employee Linder. Thus, Linder testified that he had been instructed specifically to wear and use a safety belt when working on a scaffold. In addition, he had been told that he would be fired if he was caught working on a scaffold without a safety belt. Linder stated that, so far as he knew, Wiese had enforced its safety rules. He further testified that he had attended the weekly safety meetings and that safety belts had been discussed at almost every meeting.

The Secretary did not attempt to rebut Wiese's evidence on its safety program. Nor did he seek to establish what further efforts Wiese could have made to prevent the incident that led to the citation.

B

The judge affirmed the citation's allegation of noncompliance with section 1926.28(a) as a serious but not repeated violation of the Act. He credited all of Linder's testimony, including specifically Linder's testimony that he and his co-worker were ordered by their foreman to return to their work station without safety belts. The judge concluded that Wiese was responsible for its foreman's order even though the order contravened Wiese's policy. The judge found that Wiese failed to show that its foreman was adequately instructed about his duty to require his crew to use protective equipment. He refused to find, as Wiese argued, that the behavior of either the foreman or the two employees was unpreventable employee misconduct excusing Wiese from its noncompliance with the standard in this instance. Nevertheless, despite his holdings, the judge repeatedly referred to Wiese throughout his decision as a "safety minded employer."

On review, Wiese advances three arguments for reversal. First, Wiese claims the evidence, particularly Linder's testimony, was unpersuasive and insufficient to establish a violation. Second, it suggests that the conduct of the employees in following Hall's asserted order was unpreventable misconduct, because the employees knew they could be fired for working without tied-off safety belts. In addition, Wiese argues that, if Hall did order the employees to work without protection, the order is not imputable to Wiese.

The Secretary generally endorses the judge's findings and conclusions on this citation. In urging the Commission to reject Wiese's contention that Hall's misconduct was unpreventable, the Secretary cites only the judge's finding that the record does not establish that Hall received proper training and the absence of evidence that either Hall or the employees involved were disciplined as a result of the incident in question.

C

Chairman Rowland and I defer to the judge's decision to credit the testimony of employee Linder as to the events surrounding Wiese's alleged noncompliance with section 1926.28(a). Accordingly, we agree with the judge that the failure of the employees to wear safety belts cannot be deemed unpreventable employee misconduct because they were acting pursuant to their supervisor's instructions. However, we conclude that the judge erred in his determination that Wiese was responsible for the order issued by its foreman even though that order contravened Wiese's policy.

In order to establish a violation of section 5(a)(2) of the Act, the Secretary must prove, among other things, that the cited employer either knew or could, with the exercise of reasonable diligence, have known of the presence of the violative conditions. Daniel International Corp., Wansley Project, 81 OSAHRC 71/D6, 9 BNA OSHC 2027, 1981 CCH OSHD ¶ 25,813 (No. 76-181, 1981). Generally, the actions and knowledge of supervisory employees are imputed to the employer and the employer is responsible for violations committed by their supervisors. Accordingly, the Secretary establishes a prima facie showing of knowledge by proving, as he did in this case, that a supervisory employee was responsible for the violation. See United Geophysical Corp., 81 OSAHRC 77/D6, 9 BNA OSHC 2117, 1981 CCH OSHD ¶ 25,579 (No. 78-6265, 1981), appeal filed, No. 81-4342 (5th Cir. Aug. 26, 1981). However, the employer can rebut this showing by affirmatively demonstrating that the supervisory employee's misconduct could not have been prevented. United Geophysical Corp., supra; Floyd S. Pike Electrical Contractor, Inc., 78 OSAHRC 50/E1, 6 BNA OSHC 1675, 1978 CCH OSHD ¶ 22,805 (No. 3069, 1978). In particular, the employer must establish that it effectively communicated work rules to employees and that its rules were effectively enforced through supervision adequate to detect failures to comply with rules and discipline sufficient to discourage such violations. Id.

We conclude that Wiese has rebutted the Secretary's prima facie showing of knowledge in the case now before us. Wiese established a work rule on the use of safety belts, repeatedly communicated that work rule, and enforced the rule through supervision and disciplinary measures. The Secretary's challenges to Wiese's showing are not persuasive. Wiese's unrebutted evidence concerning the communication of its work rule to all employees, including supervisors, is sufficient to establish that Hall received the same training afforded all employees. Moreover, the fact that Hall and the two employees involved in the incident at issue were not discharged does not compel a finding that Wiese failed to enforce its work rule, particularly in the face of overwhelming evidence to the contrary. For the reasons stated, Chairman Rowland and I conclude that the Secretary failed to sustain his burden of proving a violation of section 5(a)(2) of the Act and we therefore vacate the citation alleging noncompliance with 29 C.F.R. § 1926.28(a).

III

Accordingly, that part of the judge's decision and order finding Wiese in serious violation of the Act for noncompliance with 29 C.F.R. § 1926.28(a) is reversed and the citation is vacated. The Commission affirms the portions of the judge's decision and order finding Wiese and Industrial in serious violation of the Act for noncompliance with 29 C.F.R. § 1926.451(a)(13) and assessing penalties of $225 against Wiese and Industrial for this violation.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: MAR 31 1982

COTTINE, Commissioner, concurring:

I join in the Commission's order affirming the citations for serious violation of the Act based on the failure of Wiese and Industrial to comply with 29 C.F.R. § 1926.451(a)(13) and vacating the citation issued to Wiese alleging a serious violation of 29 C.F.R. § 1926.28(a). However, further explanation of these holdings is necessary.

I

With respect to the section 1926.451(a)(13) allegations, there are several significant areas of disagreement between the majority position as stated in Part I of the lead opinion and the dissenting opinion. In particular, the majority opinion and the dissenting opinion sharply diverge regarding the proper interpretation of the cited standard, the correct allocation of burdens of proof between the Secretary and the Respondents, and the determination of whether the judge's findings are supported by the preponderance of the record evidence. While I join Commissioner Cleary in entering the findings and conclusions of Part I of the lead opinion, I find it necessary to set forth more fully the basis of those findings and conclusions and the reasons for rejecting the contrary views expressed in the dissenting opinion.

The dissent characterizes section 1926.451(a)(13) as a standard "which impose[s] broad requirements on employers simply to protect against 'hazards'." It concludes that the standard is unenforceably vague unless it is "defined and limited by objective criteria sufficient to apprise an employer of his obligations" under the standard. In addition, the dissent concludes that, in the absence of this objective criteria, it is appropriate to impose on the Secretary the same burden of proof he has under the "general duty clause," i.e., section 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1), specifically, the burden of proving the feasibility and likely utility of a means of abating the hazard at issue.

The lead opinion concludes that the standard is not unenforceably vague. Commissioner Cleary and I do not go beyond the confines of the express terms of the standard in search of "objective criteria" to define and limit the employer's obligation, as our dissenting colleague does. In addition, we place on Respondents the burden of proving an affirmative defense such as impossibility or the greater hazard defense rather than placing on the Secretary the burden of proving that a safer means of access could have been utilized.

The dissent's analysis errs in characterizing 29 C.F.R. § 1926.451(a)(13) as a standard "which impose[s] broad requirements on employers simply to protect against 'hazards'." The standard at issue is clearly directed to a specific and distinct hazard, the danger of falling while ascending to or descending from a scaffold. Moreover, the standard specifically identifies the primary means of abating this hazard, i.e., "[a]n access ladder." The fact that the standard provides flexibility to employers by allowing them to use alternative means of access does not in any way change this clear and specific standard into a broad, general or potentially vague standard. On the contrary, the standard itself provides "objective criteria sufficient to apprise an employer of his obligations" under the standard. Thus, an alternative means of access is permissible under the standard if it provides "equivalent safe access," i.e., it is equivalent in terms of safety to the protection that would be provided by using an access ladder.

Accordingly, the dissent errs in concluding that it is appropriate to impose on the Secretary the same burden of proof he has under "the general duty clause." Because this case arises under section 5(a)(2) of the Act rather than section 5(a)(1), the Secretary does not have the burden of proving the feasibility and likely utility of compliance with the cited standard. Instead, Respondents have the burden of proving an affirmative defense such as impossibility or

the greater hazard defense. See, e.g., Ed Cheff d/b/a Ed Cheff Logging, 81 OSAHRC 60/A2, 9 BNA OSHC 1883, 1981 CCH OSHD ¶ 25,431 (No. 77-2778, 1981), appeal filed, No. 81-7493 (9th Cir. July 27, 1981). See also A.E. Burgess Leather Co. v. OSHRC & Secretary of Labor, 576 F.2d 948 (1st Cir. 1978).

Because the standard itself provides clear guidance, I also reject the dissent's conclusion that it is necessary to look beyond the terms of section 1926.451(a)(13) to the requirements of other standards in order to determine whether an employer has complied with its obligation under the cited standard. In particular, the dissent erroneously states that "Commission precedent acknowledges that an employer is not in violation of § 1926.451(a)(13) unless the record demonstrates that it has failed to comply with other provisions of subpart L." Two cases are cited for this proposition: Perini Corp., 77 OSAHRC 65/A2, 5 BNA OSHC 1343, 1977-78 CCH OSHD ¶ 21,790 (No. 12589, 1977), and Rust Engineering Co., 77 OSAHRC 37/C8, 5 BNA OSHC 1183, 1977-78 CCH OSHD ¶ 21,693 (No. 12200, 1977). However, neither case stands for the cited proposition. Perini Corp. is clearly inapposite because the standard at issue in that case, 29 C.F.R. § 1926.451(e)(5), permits the employer to choose between only two specified means of access--ladders or stairways. Accordingly, the issue in that case was whether the employer had provided a "ladder," not whether it had provided "equivalent safe access." Moreover, in Rust Engineering, the Commission held only that it was "appropriate" for the judge, under the circumstances of that case, to refer to the specification standards for metal ladders in determining whether the end frame of a scaffold provided equivalent safe access because the specification standards "establishe[d] a basis for determining at least approximate equivalence." 5 BNA OSHC at 1184, 1977-78 CCH OSHD at p. 26,049. The Commission's decision neither expressly nor implicitly holds that a violation of section 1926.451(a)(13) cannot be sustained in the absence of noncompliance with a ladder specification

standard. On the contrary, the decision clearly indicates that the ultimate test for determining whether equivalent safe access has been provided is the test that Commissioner Cleary and I have applied in the cases now before us, i.e., whether the alternative means of access provides the employees access "as safe as that provided by a properly constructed ladder" or "the same protection as an employee using a ladder." Id.

In Rust Engineering, it was "appropriate" to refer to the specification standards for metal ladders because the means of access provided, the scaffold end frame, was structurally similar to a metal ladder. In the cases now before us, however, the means of access provided -- climbing a ladder, crossing an open horizontal gap, and then climbing up the side of a crane trolley -- is not structurally comparable to a ladder. Accordingly, reference to the ladder specification standards is inappropriate in these cases. Nevertheless, even if the test adopted by the dissent is applied, it cannot be concluded that "all the technical requirements of the ladder standard have been met." Thus, if the means of access provided by Respondents is compared to a ladder, the segment of the access route between the sheet metal girder and the I-beam is comparable to a ladder placed in a horizontal position with a 24-inch separation between rungs. Such a ladder would fail to comply with at least two specific requirements of Subpart L. First, it would not comply with the incorporated provisions on the spacing of rungs. See Perini Corp., supra; Rust Engineering Co., supra. Second, it would be contrary to the requirements of 29 C.F.R. § 1926.450(a)(7), which states, in pertinent part:

> (7) . . . . Ladders shall not be used in a horizontal position as platforms, runways, or scaffolds.

Because it is clear that a ladder with a 2-foot-wide opening on a horizontal plane would not comply with the specifications of subpart L, the Secretary has established noncompliance with the cited standard even under the dissent's erroneous interpretation of the standard.

One further matter requires elaboration. The standard's alternative requirement of "equivalent safe access" makes it necessary to consider whether the means of access provided was safe. In his decision below, Judge Oringer expressly found that employees were exposed to a falling hazard during the course of their access to the scaffold. The dissent analyzes the record evidence and concludes that the Secretary failed to prove the existence of this hazard by a preponderance of the evidence. Although the lead opinion implicitly adopts the judge's finding, it does not set forth the basis for this holding. Accordingly, the record must be reviewed to determine whether the judge's finding is supported by the preponderance of the evidence. E.g., Astra Pharmaceutical Products, Inc., 81 OSAHRC 79/D9, 9 BNA OSHC 2126, 1981 CCH OSHD ¶ 25,578 (No. 78-6247, 1981), appeal filed, No. 81-1672 (1st Cir. Sept. 23, 1981).

The judge based his finding on the opinion testimony of the compliance officer who asserted that employees stepping across the 2-foot-wide gap were exposed to the hazard of falling either 20 or 42 feet. In addition, the Secretary offered the testimony of Edward Tannehill, a millwright who had worked from the scaffold under Wiese's direction. Tannehill confirmed the compliance officer's testimony that Tannehill, in his capacity as millwright steward, had initiated the investigation of the access to the scaffold by making an oral complaint during the inspection that the means of access was unsafe. The evidence that could be viewed as contradicting the Secretary's evidence consists of the opinion testimony of three witnesses for Respondents: assistant superintendent Ouber; John Thigpen, Industrial's vice president; and Herman Thompson, Wiese's manager of safety and security. Thigpen expressed his opinion that the means of access provided by Respondents was safe because an employee could hold on to "the crane" while stepping onto the I-beam and the beam provided "a good foot place, a good place to step." Ouber and Thompson both testified in effect that the means of access provided was, in their view, the safest possible means under the circumstances.

The Respondents' evidence does not effectively rebut the Secretary's prima facie showing that the 2-foot gap was hazardous. I am not persuaded by Thigpen's opinion that the presence of something to hold on to and a solid surface to step onto eliminated the hazard involved in stepping from a 6-inch-wide sheet girder over a 2-foot-wide opening that was 20 feet above the nearest floor. Specifically, Thigpen had never used the means of access in question and Respondents introduced no evidence that Thigpen had any expertise in the field of safety. Moreover, the testimony of Ouber and Thompson does not go to the question of whether the 2-foot gap presented a hazard but rather to the question of whether other possible methods of access would have been even more hazardous. Indeed, when Thompson was directly asked for his opinion as to whether the means of access provided was "safe," his only response was that "I checked it out and I couldn't see any other way that it [the ladder] could be put without having to move it everytime those cranes would move back and forth." Accordingly, the judge's finding is supported by the preponderance of the evidence and I expressly affirm that finding.

For the reasons set forth in Part I of the lead opinion, as necessarily amplified by this separate opinion, I affirm the judge's conclusion that Wiese and Industrial failed to comply with section 1926.451(a)(13).

II

With respect to the allegation that Wiese was in serious violation of the Act based on noncompliance with section 1926.28(a), I agree with the majority's decision to affirm the judge's credibility determination and his rejection of Wiese's unpreventable employee misconduct defense to the extent it was based on the asserted misconduct of Linder and his co-worker. However, I conclude that the judge erred in failing to sustain Wiese's unpreventable employee misconduct defense based on the misconduct of foreman Hall and, accordingly, I join in the Commission's order vacating the section 1926.28(a) citation.

An employer is responsible for a violation committed by its supervisory employee, i.e., the employee's actions and knowledge are imputed to the employer, unless the employer demonstrates that the supervisor himself was adequately supervised regarding safety matters. E.g., United Geophysical Corp., 81 OSAHRC 77/D6, 9 BNA OSHC 2117, 1981 CCH OSHD ¶ 25,579 (No. 78-6265, 1981), appeal filed, No. 81-4342 (5th Cir. Aug. 26, 1981); Floyd S. Pike Electrical Contractor, Inc., 78 OSAHRC 50/E1, 6 BNA OSHC 1675, 1978 CCH OSHD ¶ 22,805 (No. 3069, 1978); Connecticut Natural Gas Corp., 78 OSAHRC 60/B3, 6 BNA OSHC 1796, 1978 CCH OSHD ¶ 22,874 (No. 13964, 1978). In order to establish this affirmative defense, the employer must prove that it effectively communicated work rules to employees and that its rules were effectively enforced, that is, it provided supervision adequate to detect noncompliance with the rules and discipline sufficient to discourage such noncompliance. Id. I conclude that Wiese has sustained its defense in this case for the reasons discussed in the lead opinion with respect to the communication and enforcement of Wiese's work rule.

ROWLAND, Chairman, Dissenting in Part:

For the reasons stated by Commissioner Cleary in part II C of the lead opinion, 8/ I join in reversing the judge's decision and vacating the citation alleging that Respondent Wiese failed to comply with 29 C.F.R. § 1926.28(a). For the reasons that follow, I conclude that the judge also erred in finding that Respondents Wiese and Industrial failed to comply with 29 C.F.R. § 1926.451(a)(13), and therefore I dissent from the remainder of the majority opinion.

In concluding that Respondents failed to comply with § 1926.451(a)(13) the majority reasons that the existence of a fall hazard between the ladder and the point of access onto the crane scaffold is sufficient to show that access equivalent in safety to that which a ladder would have provided was not maintained. I disagree with this reasoning since I cannot identify objective facts which would give Respondents notice that the existing means of access was unsafe.

As the majority notes, standards which impose broad requirements on employers simply to protect against "hazards" are vague unless defined and limited by objective criteria sufficient to apprise an employer of his obligations under such standards. E.g., Ryder Truck Lines v. Brennan, 497 F.2d 230 (5th Cir. 1974); Owens-Corning Fiberglas Corp., 79 OSAHRC 26/D6, 7 BNA OSHC 1291, 1979 CCH OSHD ¶ 23,509 (No.

---

8/ As Commissioner Cleary correctly notes, under Commission precedent an employer may rebut the Secretary's showing of knowledge based on the imputation of the actions of a supervisory employee by demonstrating that it both communicated and enforced a work rule pertaining to the conduct in issue. Since Wiese satisfied its burden under Commission precedent, I do not find it necessary to consider at this time whether that precedent is correct insofar as it would impose on the employer a duty to enforce as well as to communicate work rules to employees. For a discussion of the question whether an employer should be required to do anything more than give instructions to employees regarding the proper use of safety equipment, see General Electric Co. v. OSHRC, 540 F.2d 67, 69 (2d Cir. 1976); Borton, Inc., No. 77-2115 (March 31, 1982) (dissenting opinion).

76-4990, 1979), aff'd, 659 F.2d 1285 (5th Cir. 1981) (29 C.F.R. § 1910.132(a) 9/ ); Voegele Co., 79 OSAHRC 76/A2, 7 BNA OSHC 1713, 1979 CCH OSHD ¶ 23,860 (No. 76-2199, 1979), aff'd, 625 F.2d 1075 (3d Cir. 1980) (29 C.F.R. § 1926.28(a) 10/ ). Under Commission precedent, the particular specifications set forth in subpart L for ladders 11/ have been used to interpret the requirement of § 1926.451(a)(13) that a ladder or "equivalent safe access" be provided. Indeed, Commission precedent acknowledges that an employer is not in violation of § 1926.451(a)(13) unless the record demonstrates that it has failed to comply with other provisions of subpart L. See Perini Corp., 77 OSAHRC 65/A2, 5 BNA OSHC 1343, 1977-78 CCH OSHD ¶ 21,790 (No. 12589, 1977) (interpreting § 1926.451(e)(5), an analogous standard, and concluding that the employer had failed to provide a ladder under § 1926.451(e)(5) because the spacing of the rungs on the scaffold endframes did

---

9/ This standard requires as follows:

> Protective equipment, including personal protective equipment for eyes, face, head, and extremities, protective clothing, respiratory devices, and protective shields and barriers, shall be provided, used, and maintained in a sanitary and reliable condition wherever it is necessary by reason of hazards of processes or environment, chemical hazards, radiological hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact.

10/ This standard requires that the employer be "responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions . . . ."

11/ Subpart L, entitled "Ladders and Scaffolding," includes sections 1926.450 (ladder) and 451 (scaffolding). Section 1926.450, in addition to the general requirement at § 1926.450(a)(1), includes a number of specifications for fixed ladders and manufactured and job-made portable ladders. The specifications govern such matters as the length, width, and pitch of ladders and the materials for the construction of side rails and rungs.

not satisfy the requirements for ladders set forth in subpart L) and Rust Engineering Co., 77 OSAHRC 37/C8, 5 BNA OSHC 1183, 1977-78 CCH OSHD ¶ 21,693 (No. 12200, 1977) (holding the term "equivalent" as used in the standard at issue in this case means "virtually or in effect identical to a ladder"). 12/

In this case the Secretary presented no evidence or argument that the method of access provided by Respondents was contrary to any particular specification prescribed in subpart L such as § 1926.450(a)(10), which requires that portable ladders be "tied, blocked, or otherwise secured to prevent their being displaced," or § 1926.450(a)(9), which provides, "[t]he side rails shall extend not less than 36 inches above the landing. When this is not practical, grab rails, which provide a secure grip for an employee moving to or from the point of access, shall be installed." On the other hand, Respondents adduced evidence showing compliance with those specifications. On cross-examination, Welch, the compliance officer, conceded that the ladder was fully secured both to the compressor deck and to the girder above. Thigpen, Industrial's vice-president, testified that the top of the ladder was two to three feet higher than the beam and stated that an employee could hold onto the crane structure while moving across the open space. Accordingly, a preponderance of the evidence does not establish that the means of access violated any requirement of subpart L of the Secretary's standards. Indeed, I note that the majority concedes that the cited standard does not require that the access ladder extend all the way to the scaffold. See Frank Briscoe Co., 76 OSAHRC 129/A2, 4 BNA OSHC 1729, 1976-77 CCH OSHD ¶ 21,162 (No. 7792, 1976) (citation alleging violation of § 1926.450(a)(1) in that

---

12/ Steel Erectors, Inc., 81 OSAHRC 18/F1, 9 BNA OSHC 1399, 1981 CCH OSHD ¶ 25,228 (No. 77-1118, 1981), on which the majority relies, is incorrectly decided and should not be followed insofar as it holds that the question whether access is equivalent in safety to that of a ladder does not require consideration of the specifications prescribed for ladders.

horizontal rebar protruded through the rungs of a ladder vacated since no provision of that standard prohibits the use of ladders over horizontal rebar). Since it is apparent that all the technical requirements of the ladder standard have been met, the cited access can only be found unsafe, and thus not in compliance with the standard, if other objective facts exist which apprise the employer that the means of access provided is hazardous.

The majority finds the "access route" unsafe solely on the opinion of the compliance officer that a fall hazard existed. Commissioner Cottine would also credit similar opinion testimony of one employee. On the other hand, Thigpen, Industrial's vice-president, who had worked for Industrial for seven years, considered the ladder to be safe. He stated that an employee would hold onto the crane rail while stepping onto the beam, and in describing the beam he said, "[i]t is a good foot place, a good place to step on the bottom and on the top and then the crane was immediately above that." He further testified that no one had ever fallen from the ladder, that he had never observed anyone coming close to falling, and that Industrial's electrician employees had never made any complaints about the ladder. Thompson, Wiese's safety manager, who, as the majority notes, implements Wiese's safety program, stated that the ladder was the safest means of access available in the circumstances. Similar testimony was given by Ouber, Wiese's assistant superintendent, who not only had 25 years experience in the construction industry but for at least two years had been concerned with safety matters at the worksite where the crane was located. As the statement of Ouber's testimony in the majority opinion itself indicates, Ouber had considerable first-hand experience with the matter of providing access to the crane in question. The compliance officer's opinion on which the majority relies as well as the opinion of one employee is not sufficient to prove the

existence of a hazard by a preponderance of the evidence in view of the contrary testimony of Respondents' experienced witnesses that they considered the access safe and the absence of any other evidence to show that Respondents should have had notice that a fall hazard existed. See S & H Riggers & Erectors, Inc. v. OSHRC, 659 F.2d 1273 (5th Cir. 1981); Owens-Corning Fiberglas, supra; Air-Kare Corp., 81 OSAHRC , 10 BNA OSHC 1146, 1981 CCH OSHD ¶ 25,758 (No. 77-1133, 1981) (dissenting opinion).

The majority also errs, as did the Judge, in accepting as dispositive the compliance officer's testimony that safe access could have been provided through the alternative of installing a sloped platform across the open space. The compliance officer based this opinion on one of the photographs he had taken and on a sketch he made at the hearing of the crane and compressor area. The record does not indicate that the compliance officer actually examined the structure where he believed a platform could be placed nor did he testify that he had any knowledge of the method of access he described having been used by any other employer in a similar situation. Furthermore, the Secretary did not establish that the compliance officer had any prior experience with overhead bridge cranes and in particular with the means of access thereto. 13/

Because the compliance officer's testimony is not based on personal knowledge or experience with the means of access he described, his opinion that a sloped platform could be used is merely an abstract suggestion of a possible abatement method.

---

13/ The compliance officer's experience is described in general terms as eight years' safety experience, three as a compliance officer and five as a consultant and engineer for companies involved in construction work.

Absent a supporting factual foundation, 14/ his opinion is theoretical and speculative and as such is not entitled to controlling weight. See Ray Evers Welding Co. v. OSHRC; 625 F.2d 726, 733 (6th Cir. 1980); Air-Kare, supra (dissenting opinion).

Even assuming that a sloped platform as described by the compliance officer could physically have been installed, the testimony of Respondents' witness not only establishes that this method would not have been practical because of its slope but also shows that there was no other practical means of providing access to the scaffold. 15/

---

14/ The majority observes that Wiese's assistant superintendent Ouber conceded that a platform could be installed. Ouber did not, however, concede that such a platform could have been used to correct the hazardous condition existing on the worksite at issue in this case. In response to a question from the Secretary's counsel on cross-examination as to whether a platform as described by the compliance officer would have been "possible," Ouber stated that while possible, such a platform would not have been level. At another point in his testimony, he specifically stated that he had concluded that a sloped platform could not be used because its slope would create a greater hazard of a fall than the existing ladder. Similarly, while Ouber indicated that a platform could physically be installed in such a manner as to be level, he stated that the welding necessary for a level platform would itself create other hazards. See the discussion infra. The entirety of his testimony, therefore, demonstrates that a platform could not have been used as a means of access under the circumstances in question.

15/ The majority errs in discussing Respondents' evidence in terms of the impossibility and greater hazards defenses. As discussed above, the majority interprets the standard to require a "safe" means of access without regard to the ladder specifications set forth in other standards as a guide to the employer in determining what constitutes "safe" access. Since the standard as interpreted by the majority does not on its face prescribe objective criteria for measuring the scope of the employer's duty, the same burden of proof should be imposed on the Secretary as he has under the so-called "general duty clause" of the Act, 29 U.S.C. § 654(a)(1), which requires that the employer maintain a workplace free from "recognized" hazards. That is, the Secretary must demonstrate what steps Respondents could have taken to improve the safety of the scaffold access and specifically must show the feasibility and utility of another method of access. Evidence adduced by Respondents showing that means of providing access other than the method they had selected would have adverse consequences is relevant as rebuttal to the Secretary's case-in-chief as opposed to a separate affirmative defense. See Royal Logging Co., 79 OSAHRC 84/A2, pp. 19-20, 7 BNA OSHC 1744, 1751, 1979 CCH OSHD ¶ 23,914 at pp. 28,997-98 (No. 15169, 1979), aff'd, 645 F.2d 822 (9th Cir. 1981).

In dismissing as unpersuasive Ouber's opinion that because of its slope use of a platform would increase the hazard to employees, the majority concludes that the platform would be safer than the access provided by Respondents if the platform were equipped with guardrails. However, there is no evidence to support this conclusion. Although Welch stated that a platform with guardrails would provide safe footing, it is not clear from his testimony whether in reaching this opinion he took into consideration the fact that a platform secured as he described would necessarily be slanted. Furthermore, Ouber's opinion that a sloped platform would be hazardous is reasonable in view of the magnitude of the slope involved. 16/ Finally, Thigpen's testimony, as indicated above, demonstrates that in any event the existing means of access was also sufficient to provide safe footing for employees.

Similarly, the majority errs in dismissing Respondents' objections to a welded level platform and use of a removable ladder as speculative and unsupported by the record. Ouber's opinion that welding would not be practical because it would create an explosion hazard and would interfere with the structure of the building and weaken the crane to the point of possible collapse is unrebutted. In view of Ouber's extensive experience on the worksite and with the crane in question, his opinion is reasonable and entitled to weight. His judgment that a removable ladder also would not be feasible because an employee

---

16/ It is undisputed that the platform described by Welch would have to be inclined a vertical distance of 12 inches over a horizontal distance of 24 inches, a ratio of 1 to 2. The Secretary's fall protection standard for sloped roofs, 29 C.F.R. § 1926.451(u)(3), applies to roofs sloped in excess of 4 inches in 12 inches, a ratio of 1 to 3. Accordingly, the Secretary considers slopes which are less than the slope involved in this case to present a falling hazard. See Hamilton Roofing Co., 78 OSAHRC 57/C1, pp. 7-8, 7 BNA OSHC 1771, 1773, 1978 CCH OSHD ¶ 22,856 at p. 27,642 (No. 14968, 1978).

could be deprived of a means of descent when needed including an emergency situation also is both reasonable and undisputed. While the majority discredits this opinion on the ground that there is no evidence to show that the ladder could not have been replaced whenever a means of descent was needed, Respondents do not have any burden to present such evidence. Rather, as explained above 17/ the burden is on the Secretary to show that a feasible means of providing safe access was available. Since the Secretary adduced no evidence to rebut Ouber's opinion that a removable ladder would not have been practical, he has not satisfied his burden of proof.

Since the record fails to show that the means of access provided by Respondents was unsafe according to any objective criteria and since the Secretary in any event failed to prove that any safer means of access could feasibly have been used, 18/ the citations alleging failure to comply with 29 C.F.R. § 1926.451(a)(13) should be vacated.

---

17/ See footnote 15, supra.

18/ I do not agree with the majority's conclusion, stated in footnote 6, that the judge did not base his finding of a violation on the fact that a different means of access, as described by Ouber, was used after the citations were issued. In discussing the evidence, the judge stated, "Mr. Welch's testimony anent [sic] abatement was logical. A landing platform could have been built and braced between the sheet girder and the lower flange on the crane rail. Feasible means were utilized by the respondent to cure this hazard after the inspection." In his enumerated factual findings, the judge reiterated both compliance officer Welch's opinion testimony and the testimony of an employee describing the means of access used after the inspection. While the judge obviously did not consider Respondents' post-inspection conduct to be dispositive, he clearly relied on it. Indeed, his decision indicates that he considered this evidence to be corroborative of the compliance officer's opinion that a different means of access could have been provided. Since, as the majority notes, there is no dispute that the means of access used subsequently could not have been applied prior to the inspection because it would have prevented the necessary movement of the crane, the judge erred in according any weight to Respondents' post-inspection conduct.

|---|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>H. E. WIESE, INC., AND INDUSTRIAL ELECTRICAL CONSTRUCTION COMPANY,<br><br>Respondent. | ) | OSHRC Docket Nos. 78-204 and 78-205 (CONSOLIDATED) |

APPEARANCES

FOR THE COMPLAINANT

James E. White, Acting Regional Solicitor;
Max A. Wernick, Esquire, of Counsel,
U. S. Department of Labor,
Office of the Solicitor,
555 Griffin Square Building, Suite 501,
Griffin and Young Streets,
Dallas, Texas 75202

FOR THE RESPONDENTS

Taylor, Porter, Brooks and Phillips, Esquires;
G. Michael Pharis, Esquire, of Counsel,
P. O. Box 2471
Baton Rouge, Louisiana 70821

DECISION AND ORDER

ORINGER, JUDGE: This is a proceeding under section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651, et seq., (hereinafter referred to as "The Act") to review citation(s) issued by the Secretary of Labor (hereinafter referred to as "Complainant") pursuant to section 9(a) and a proposed assessment of penalties thereon issued, pursuant to section 10(a) of the Act.

At the commencement of the trial the respondent, H. E. Wiese, Inc., withdrew its notice of contest with respect to the last citation involving three non-serious violations and also with respect to item 1 of Citation No. 1 which alleged a violation of 29 C.F.R. 1926.352(d), as well as the penalty proposed in the sum of $240. No objection being made by the Secretary, the allegation of "serious" violation of the standard set forth at 29 C.F.R. 1926.352(d) and the penalty proposed in the sum of $240 were affirmed and assessed on the record.

In its brief filed with the undersigned, subsequent to the trial of this cause, the complainant, the Secretary of Labor, moved to withdraw item 3 of "serious" Citation No. 1 against respondent, H. E. Wiese, alleging a violation of the standard set forth at 29 C.F.R. 1926.451(d)(3) and the penalty proposed therefor in the sum of $240. No objection being raised by the affected respondent, the allegation of violation of this standard and the penalty proposed therefor are both vacated.

Thus, the remaining issues before this tribunal are as follows:

1. Whether or not the respondent, Industrial Electrical Construction Company, was in violation of the standard set forth at 29 C.F.R. 1926.451(a)(13) and, in the event of such violation, was it proven to be of a "serious" character?

2. Whether the respondent, H. E. Wiese, Inc., was in violation of the standard set forth at 29 C.F.R. 1926.451(a)(13) and, if so, was the violation proven to be of a "serious" character?

3. Whether the respondent, H. E. Wiese, Inc., was in violation of the standard set forth at 29 C.F.R. 1926.28(a) and, if so, should such violation be characterized as "repeated?"

4. Whether any or all of the penalties proposed are reasonable and appropriate in the premises.

The descriptions of the remaining allegations of violation in this cause, reads as follows against the respective respondents:

INDUSTRIAL ELECTRICAL CONSTRUCTION COMPANY

| STANDARD, REGULATION OR SECTION OF THE ACT ALLEGEDLY VIOLATED | DESCRIPTION OF ALLEGED VIOLATION |
|---|---|
| 29 C.F.R. 1926.451(a)(13) | "An access ladder or equivalent safe access to scaffold(s) was not provided:<br><br>(a) X71 compressor deck, access ladder to scaffold on top of overhead crane requires employee(s) to climb ladder 20 ft. and exit onto approximately 6 inch wide beam and then step across approximately 2 feet wide gap onto overhead crane exposing employee to a fall of 20 feet to the complressor deck and 42 feet to the ground below." |

H. E. WIESE, INC.

| | |
|---|---|
| 29 C.F.R. 1926.451(a)(13) | "An access ladder or equivalent safe access to scaffold(s) was not provided:<br><br>(a) K71 Compressor deck, access ladder to scaffold on top of overhead crane requires employee(s) to climb ladder 20 feet and exit onto approximately 6 inch wide beam and then step." |
| 29 C.F.R. 1926.28(a) | "Appropriate personal protective equipment was not worn by employee(s) in all operations where there was exposure to hazardous conditions:<br><br>(a) Top deck at furnace #5, employee working at open edge erecting tube and cou pler scaffold without being protected from fall of 60 feet by safety belt and lanyard." |

## OPINION

The proof of record indicates that insofar as the allegation of violation of the standard set forth at 29 C.F.R. 1926.451(a)(13) is concerned, the ladder provided did not reach the exact area upon which the employees had to step to work and they had to do some climbing that left a fall space that could have resulted in a fall of 20 feet and possibly in some cases to 42 feet. The evidence clearly discloses a potential fall hazard space of approximately two feet and employees were exposed thereto.

Mr. Welch's testimony anent abatement was logical. A landing platform could have been built and braced between the sheet girder and the lower flange on the crane rail. Feasible means were utilized by the respondent to cure this hazard after the inspection.

The standard requires an access ladder or equivalent safe access shall be provided. In my opinion, the access provided and the access ladder comprised a hazard and when the standard requires that an access ladder shall be provided, it means a safe access ladder. In this case, the area to which access was needed contined a hazard. Accordingly, in my opinion, a violation of the standard has been proven.

The respondent argues that the crane could not have been used without such an access hazard being present. After reviewing all of the evidence, I do not agree. The evidence is likewise clear that Industrial Electrical Construction Company had two employees working on the scaffold who had utilized the means of access and were installing lighting in the compressor area and, therefore, had been exposed to the hazard. Accordingly, I find that inasmuch as employees of Industrical Electrical Construction Company were exposed to the hazard, the violation was proven against that respondent.

Whether the violation was proven against H. E. Wiese, Inc., contains a further question. The only exposure determined by the Secretary of any other employee was a Mr. Tannehill, who was employed by National Maintenance Company, a separate respondent, however, National Maintenance and H. E. Wiese, Inc., apparently interchanged employees throughout this construction job. In the case involving Mr. Tannehill, while he was paid by National Maintenance Company, he was told where to work and what to do in this instance by H. E. Wiese, Inc. In my opinion, this constitutes sufficient supervision so as to constitute him an employee of H. E. Wiese for the purposes of this Act. Mr. Tannehill described the ascent up the ladder as climbing up and then swinging around to get up on the crane. Mr. Tannehill, the employee who was exposed, was reporting to a supervisor named Voltz, who worked for H. E. Wiese, Inc. However, Mr. Voltz apparently reported to a Mr. Oliver. The immediate supervisor of Mr. Tannehill was Mr. Faus who was employed by National Maintenance. Mr. Voltz and or Mr. Oliver, who were supervisors working for H. E. Wiese, Inc., determined where Tannehill and other employees were going to work and what they were going to do from day to day and, in my opinion, this constituted sufficient supervision to give Voltz and Oliver the duty to make sure that employee Tannehill had a safe area in which to work. Accordingly, I find that the exposure of Mr. Tannehill was sufficient to prove a violation against H. E. Wiese, Inc. Considering the rapid abatement, the fact that only one allegation of violation was made against Industrial Electrical Construction Company and the record indicating that H. E. Wiese, Inc., is a generally safety minded employer, penalties of $225 against each respondent is sufficient to ensure compliance with this standard in the future.

I find the testimony of Mr. William Earl Linder, veritable and of considerable weight, when weighing the allegation of violation of the standard set forth at 29 C.F.R. 1926.28(a). I fully credit his testimony that he and a fellow employee asked his foreman for safety belts and that he was advised that there were none in stock at the time. I further credit his testimony that his foreman, one Mr. Hall, sent them back aloft despite the fact that he knew that the men were not wearing safety belts and thus could not utilize them. It is unfortunate that Mr. Hall's testimony is not in the record, however, I fully credit Mr. Linder insofar as all of his testimony is concerned.

I can further understand the reluctance and refusal of the men to use a safety belt made of rope that they believed to be dangerous. The fact that the safety belt made of rope later proved to withstand 4,000 pounds does not mean that it had the appearance of safety. It is easy to understand a worker preferring to work without a belt than one that appeared to be hazardous to use. An unsafe belt certainly would lull one into a sense of security and create a more dangerous atmosphere than even working without a belt. In my opinion, the employee was fully justified in believing that a belt made of rope would be more dangerous than having none at all.

I credit H. E. Wiese, Inc. with having a policy requiring the wearing of safety belts and from time to time terminating employees for failing so to do. In this case, however, when the work had to be done and no safety belts were available, its foreman sent the men up to work without belts. This is not a case of an isolated idiosyncratic act by an employee. This is not a foreman who exposed himself dangerously in a manner that could not be ascertained by his employer. This is a case where the respondent's foreman

exposed the employees to a hazard. I fully credit Mr. Linder's testimony that the reason he was not wearing a safety belt was the unavailability of safety belts at the time. Regardless of the fact that he and Benton may have been careless in putting down their belts so that some other employees could remove them, this does not excuse the foreman for allowing, suffering, permitting and ordering the men to go back aloft despite his knowledge that they did not have safety belts. The employees had little choice if they refused to go aloft. They would have been terminated for refusing to obey an order from a superior. While the forman's instructions may have been contrary to H. E. Wiese, Inc. written policy, failure to follow the orders of foreman Hall would have resulted in termination to the employees. Accordingly, they had little choice in the matter and, in my opinion, a violation was proven insofar as the standard set forth at 29 C.F.R. 1926.28(a) is concerned. The safety program of H. E. Wiese must be considered however when assessing a penalty.

Insofar as the allegation of "repeated" violation is concerned, I find that this characterization must fall. I find that H. E. Wiese definitely separates its maintenance side from its construction side. The prior violation was by maintenance as contrasted with its construction side. The construction division and the maintenance division are bifurcated and have different supervisors and different tasks and are paid different rates. Accordingly, I find that this was not proven to be a "repeated" violation. In any case, the penalty proposed was in the sum of $800 and as the Commission has stated time and again, the characterization of whether this was a "serious" violation or a "repeat" violation is not important inasmuch as the penalty proposed here can be proposed for a "serious" violation as well as a "repeated" violation. Nevertheless for the reasons previously given, I find

that this was not a "repeated" violation in that the violations were not proven to be in similar construction and the operation of the maintenance part of its business is kept completely separate from its construction business. Accordingly, the violation of the standard set forth at 29 C.F.R. 1926.28(a) is affirmed as a "serious" violation.

Insofar as the penalty is concerned, in my opinion, this is a safety minded employer and in most instances works in a safe fashion, disciplines employees for violating its rules and, accordingly, I find a penalty of $500 appropriate for the violation of the standard set forth at 29 C.F.R. 1926.28(a) herein found proven.

This tribunal gave careful consideration to the testimony of respondent's witnesses. While there was testimony that there were belts always available on the job, I find that this was not so when needed by Linder and Benton. While an employee should not be careless with equipment so necessary to his safety, at the same time carelessness of the employee, insofar as keeping his equipment is concerned, does not mean that his foreman can send him aloft and expose him to a fall hazard such as occurred in the case at bar.

The respondent argues that even if Mr. Linder's testimony was veritable, the conduct of the foreman was totally contrary to H. E. Wiese's policy and constituted an isolated incident. The respondent further argues that one belt was available and Benton was the only one who needed a safety belt inasmuch as he was the only one exposed to a fall hazard and his failure was his decision because he felt the belt was unsafe. I do not agree with either contention and, in my opinion, it was reasonable for an employee to assume that a belt made of rope, like the one that was lying there, was not a safe belt and I believe the testimony of Mr. Linder that there were no belts

available and the foreman sent them back up to the job despite his knowledge that they were not wearing belts.

As previously related, in my opinion, H. E. Wiese, Inc., is a generally safety minded employer and I believe that employees were terminated for unsafe acts. However, in this case, the foreman faced with a choice of work that would be delayed and men working without belts, had the men work without belts. Because of H. E. Wiese's safety performance and rules and programs, this tribunal mitigated the penalty. In my opinion, the cases cited by the respondent, to wit, Horne Plumbing and Heating Company v. OSAHRC and Secretary of Labor, 523 F.2d 564, Brennan v. Butler Lime and Cement Company, 520 F.2d 1011, National Realty and Construction Company v. OSHRC, F.2d 1257; Secretary v. Ocean Electric Corporation, 3 OSHC 1705, are inapplicable to the situation found in the instant cause. The hazard in this case and the employees conduct was not unforeseen or unascertainable. It resulted from the direction of a supervisory employee of this very respondent. In the case at bar, the hazard was not just foreseeable, it occurred at the direction of the respondent's supervisory employee. Despite the occurrence of the violation, however, this tribunal finds that H. E. Wiese is normally a safety minded employer, has a vital safety program, does discipline men for violations thereof and, accordingly, deserves mitigation of the penalty.

Both parties cited National Realty and Construction Company v. OSHRC. 489 F.2d 1257, in which Judge Skelly Wright in his brillant and prescient decision stated:

> "Because the behavior of supervisory personnel sets an example at the workplace, an employer has-if anything-a heightened duty to ensure the proper conduct of such personnel. Second, the fact that a foreman would feel free to breach a company safety policy is strong evidence that implementation of the policy was lax."

National Realty, supra, was cited as precedential in Secretary v. Floyd S. Pike Electrical Contractor, Inc, 6 OSHC 1781 at page 1784. In Pike, supra, the Court was of the opinion that the company's training and safety program, rather than producing an atmosphere in which ordinary employees would warn foreman of imminent risks, was inadequate to prevent crew members from following their foreman's poor example.

In the instant cause, the two employees observed aloft without belts did not follow the poor example of a foreman but followed his direction, in violating the standard. This was not an idiosyncratic isolated act.

There is no proof of record demonstrating that this foreman, Hall, was properly trained so as to create an atmosphere where belts would always be used by employees under his supervision. The proof of record clearly demonstrates that the violation was at his direction. His directions left the employees with a Hobson's choice. If they ascended aloft without belts, they faced termination, however, if they disobeyed the foreman's direction to ascend aloft and complete the work, despite the lack of belts, they would have been terminated more rapidly and without question.

Once the complainant, the Secretary of Labor, has proven that a violation in fact existed at the time of the inspection, the employer may demonstrate as an affirmative defense that the foreman who directed the men to work aloft without belts, performed an isolated idiosyncratic act. The respondent, in my opinion, has totally failed to carry this burden. In the

instant cause, the Secretary made out a prima facie case. The burden then shifted to the employer to rebut the prima facie case or establish an affirmative defense and, in my opinion, he failed so to do.

The Commission's allocation of burdens is appropriate. It may be assumed that it is much easier for the respondent to be able to show proof of the proper training and the isolated act of the foreman Hall than the Secretary's ability to prove the contrary thereto. Thus it is entirely suitable to allocate to the employer the burden of proof of his affirmative defense in this case (See Central of Georgia Railroad Company v. OSHRC and Marshall, U. S. Court of Appeals, Fifth Circuit, July 13, 1978, 6 BNA OSHC 1784).

Having heard the testimony and observed the demeanor of the witnesses and having considered the same, together with the citations, notifications of proposed penalties, notices of contest, pleadings, representations, stipulations and admissions of the parties, it is concluded that the preponderance of the credible evidence of record supports the following

## FINDINGS OF FACT

1. The respondent, Industrial Electrical Construction Company, is a Louisiana Corporation with its office in Baton Rouge, Louisiana, that does business in Baton Rouge with persons and companies who do business in interstate commerce. The respondent purchases materials that come over the State line (Tr. 9).

2. The respondent, H. E. Wiese, Inc., is a Louisiana Corporation domiciled in Baton Rouge, Louisiana, that purchases goods and materials from points outside the State of Louisiana and also has engaged in business outside the State of Louisiana (Tr. 9, 10).

3. The average daily number of employees of Industrial Electrical Construction Company is approximately 60 (Tr. 10).

4. The respondent, H. E. Wiese, Inc., employs an average number of 1500 employees in its construction business not considering its maintenance operation which is separate and apart (Tr. 10).

5. At the K71 compressor deck area of the worksite, there was an overhead bridge-type crane spanning the width of the building. The crane ran on wheels which were afixed to the structural steel beams of the building (Tr. 66).

6. A scaffold that was contained and built on top of the crane was approximately twenty feet above the compressor deck and approximately forty-two feet above the ground (Tr. 26, 27).

7. There was a portable wood extension ladder extending from the top of the compressor deck to the general area of the crane. The ladder rested on a girder (Tr. 28, 29, 30, Exhibits C-1 and C-2). The ladder was fully secured at the top and the deck of the girder (Tr. 68).

8. In order to gain access onto the scaffold, the employee would have to climb up the ladder and upon reaching a beam, step across onto the beam onto the scaffold which was on a movable trolley. The employee would step onto the sheet girder approximately six inches wide and step across a distance to the structural beam that supported the crane rails. From there, the employee would climb onto a fixed platform that was on top of the crane or trolley (Tr. 68, 69).

9. One employee, Mr. Tannehill, had to ascend to the scaffold and described his ascent as climbing up and swinging around and getting up on the crane (Tr. 99).

10. Employees ascending to gain access to the scaffold were exposed to an open span of approximately two feet and thus were exposed to a fall of twenty feet to the concrete compressor deck which could bring about broken bones, concussions, contusions and possible death (Tr. 33, 34, 37).

11. The hazard could have been abated by utilizing a landing platform which could have been built and braced between the sheet girder and the lower flange on the crane rail (Tr. 34). The respondent eliminated the hazard by building the scaffold up so that employees can get off and on without hazard (Tr. 100).

12. Two employees of Industrial Electrical Construction Company were working on the scaffold and used this method of gaining access thereto to install lighting in the compressor area (Tr. 37, 38).

13. An employee, one Edwin Tannehill, employed by National Maintenance Company, was supervised insofar as where to work by one, Cecil Voltz, a supervisor for the respondent, H. E. Wiese, Inc. Cecil Voltz was the immediate supervisor to whom Mr. Tannehill reported daily and from whom he received orders telling him where to work and what to do (Tr. 100, 101).

14. Two employees were working at the open edge of a tube and coupler scaffold erecting a scaffold. The employees were working approximately 60 feet above the ground and were employed by H. E. Wiese, Inc. The employees were working at this level and were not wearing safety belts at the time they were observed (Tr. 50, 51, 52).

15. The two employees previously referred to were exposed to a fall hazard of 60 feet which in the event of an accident occurring would result in serious injuries or death (Tr. 51, 52).

16. One, Mr. William Earl Linder, a carpenter in training employed by H. E. Wiese, Inc., was working in the furnace area on the day of the inspection herein concerned with another employee named Benton. The two employees went down to get more material and when they reached the ground, removed their safety belts. Some other employees took their belts and when Linder and Benton were ready to reascend, they did not have belts. Linder and Benton advised their foreman one, Mr. Hall, that their safety belts were gone and requested additional safety belts. The foreman, Mr. Hall, went to the Dow warehouse and requested safety belts and was advised that there were none in stock at the time. Mr. Hall instructed the two employees to go back up to the scaffold and continue their job. There was one belt lying on the floor that was made of rope that neither Linder nor Benton would use because they were afraid that it was an unsafe belt (Tr. 121 - 131).

17. In the event of an accident, it was possible for either Linder or Benton or both to fall 60 feet which probably would result in serious injury or death (Tr. 52).

18. Respondent, H. E. Wiese, Inc., generally had a stringent safety policy, insofar as safety belts were concerned, and would terminate employees for failing to follow its policy (Tr. 127).

19. In the H. E. Wiese, Inc. Company construction and maintenance are set up as two completely separate units. Each one has a director answerable to the vice president of field operations. Construction operates

independently from maintenance and have different contracts, are bargained for differently and have different rates of pay. The supervisory personnel are different people and, in fact, the construction division and the maintenance division have separate contracts with the general contractor Dow, with different scales of pay (Tr. 220-223).

20. The penalties proposed were inappropriate in the present cause and must be mitigated.

Based on the aforementioned findings of fact, opinion and the entire record, the Judge makes the following

## CONCLUSIONS OF LAW

1. At all times herein mentioned, the respondents, Industrial Electrical Construction Company and H. E. Wiese, Inc., were engaged in businesses that affected commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970 and the Commission had jurisdiction to hear and decide the within controversies.

2. The respondent, Industrial Electrical Construction Company, was in "serious" violation of the standard set forth at 29 C.F.R. 1926.451(a)(13) on the day in question at the worksite herein concerned.

3. The penalty proposed by the Secretary for the allegation of violation of the aforesaid standard, found proven herein, was excessive and a penalty of $225 is found appropriate.

4. The respondent, H. E. Wiese, Inc., having moved at the trial to withdraw its notice of contest to the allegation of "serious" violation of the standard set forth at 29 C.F.R. 1926.352(d) and to the penalty proposed therefor in the sum of $240 and such motion being granted, this item of the citation and the penalty proposed therefor must be affirmed and assessed.

5. On the day of the inspection herein concerned, the respondent, H. E. Wiese, Inc., was in "serious" violation of the standard set forth at 29 C.F.R. 1926.451(a)(13) and an appropriate penalty therefor is $225.

6. The complainant having moved at the time he submitted his brief to withdraw his allegation of violation by the respondent, H. E. Wiese, Inc., to the standard set forth at 29 C.F.R. 1926.451(d)(3) and the penalty proposed therefor in the sum of $240, such allegation of violation and the penalty proposed therefor must fall.

7. On the date of the inspection concerned herein, the respondent, H. E. Wiese, Inc., was in violation of the standard set forth at 29 C.F.R. 1926.28(a) in a "serious" manner and not in a "repeated" manner, and an appropriate penalty therefore is $500.00.

In view of the foregoing, good cause appearing therefor, it is ORDERED that:

1. The allegation of "serious" violation by the respondent, Industrial Electrical Construction Company, of the standard set forth at 29 C.F.R. 1926.451(a)(13) is AFFIRMED and a penalty of $225 is ASSESSED therefor.

2. The allegation of violation by the respondent, H. E. Wiese, Inc., of the standard set forth at 29 C.F.R. 1926.352(d) is AFFIRMED and a penalty of $240 is ASSESSED therefor.

3. The allegation of a "serious" violation by the respondent, H. E. Wiese, Inc., of the standard set forth at 29 C.F.R. 1926.451(a)(13) is AFFIRMED and a penalty of $225 is ASSESSED therefor.

4. The allegation of violation by the respondent, H. E. Wiese, Inc., of the standard set forth at 29 C.F.R. 1926.451(d)(3) and the penalty of $240 proposed therefor are both VACATED.

5. The allegation of violation by the respondent, H. E. Wiese, Inc., of the standard set forth at 29 C.F.R. 1926.28(a) in a "repeated" manner is not found, however, the allegation of violation by this respondent of the said standard set forth at 29 C.F.R. 1926.28(a) in a "serious" manner is AFFIRMED and a penalty of $500 is ASSESSED therefor.

6. A penalty of $225 is assessed against the respondent, Industrial Electrical Construction Company.

7. Total aggregate penalties of $965 are ASSESSED against the respondent, H. E. Wiese, Inc.

SO ORDERED this 12th day of September, 1978, in Atlanta, Georgia.

DECISION

Before ROWLAND, Chairman; CLEARY, Commissioner.*/

BY THE COMMISSION:

The Secretary of Labor alleges that Hull Pottery Company ("Hull") committed nonserious violations of various provisions of the OSHA asbestos standard at 29 C.F.R. § 1910.1001. The Secretary contends that Ceramitalc HDT, an industrial talc produced by the Intervenor, R. T. Vanderbilt Company, and used by Hull contains asbestos fibers, and that Hull violated section 1910.1001 by sweeping spilled Ceramitalc HDT without first wetting down the material and by failing to affix caution labels to containers of Ceramitalc HDT. Administrative Law Judge George O. Taylor, Jr. found that Ceramitalc HDT does contain asbestos fibers, but he vacated

*/ Commissioner Cottine took no part in the consideration or decision of this case.

the citation because he concluded that Hull did not and could not, with reasonable diligence, know of the presence of asbestos fibers in the talc.

The issues before us for review[1/] include whether the judge's finding that Ceramitalc HDT contains asbestos fibers is correct and, if so whether the judge properly concluded that Hull did not and could not, with reasonable diligence, have known that the talc contained asbestos fibers. We conclude that the judge properly evaluated the evidence on these issues and that his determinations are correct.[2/]

Review was also directed on whether employer knowledge is relevant to an alleged nonserious violation. The Commission has held that employer knowledge is relevant to alleged nonserious violations and that the burden rests with the Secretary to prove that an employer either did know or could have, with reasonable diligence, known of the existence of a violation in order to show that the employer violated a standard. Prestressed Systems, Inc., 81 OSAHRC 43/D5, 9 BNA OSHC 1864, 1981

---

1/ This case was previously consolidated with Baldwin Industries, Inc., OSHRC Docket No. 78-741. The cases are hereby severed for decisional purposes. Commission Rule 10, 29 C.F.R. § 2200.10.

2/ Commissioner Cleary notes that the R. T. Vanderbilt Company had been authorized by OSHA to certify that its industrial talcs do not contain asbestos if it had evidence that this was true. Pursuant to this authorization, Vanderbilt represented to users of Ceramitalc HDT that the minerals contained in the talc were "nonasbestiform." Prior to the time of the alleged violations in this case, OSHA rescinded Vanderbilt's authorization to certify that its talcs do not contain asbestos, and Vanderbilt sent a letter to some of its talc customers informing them of this. In Commissioner Cleary's view, any user of Vanderbilt talcs who received this letter would be on notice of OSHA's position that Vanderbilt talcs contain asbestos and could not be found to lack actual or constructive knowledge of this fact. Baldwin Industries, Inc., OSHRC Docket No. 78-741 (March 1982). However, there is no evidence that Hull received the Vanderbilt letter. Accordingly, Hull was entitled to rely on Vanderbilt's earlier representation that the minerals in Ceramitalc HDT were nonasbestiform, and Commissioner Cleary agrees that the judge correctly found Hull lacked actual or constructive knowledge that Ceramitalc HDT contains asbestos.

CCH OSHD ¶ 25,358 (No. 16147, 1981); General Electric Co., 81 OSAHRC 42/A2, 9 BNA OSHC 1722, 1981 CCH OSHD ¶ 25,345 (No. 13732, 1981). Accordingly, having found that the Secretary failed to prove that Hull either knew or, with reasonable diligence, could have known that Ceramitalc HDT contains asbestos fibers, Judge Taylor properly vacated the citation. Because we conclude that the judge correctly disposed of the case on the knowledge question, we do not reach whether the judge properly interpreted the standards Hull was charged with violating.

Accordingly, the judge's decision to vacate the citation is affirmed.[3/] SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRTARY

DATED: MAR 31 1982

---

3/ Because Hull is not aggrieved by our disposition of the case, we deny its motion to reopen the record without deciding whether reopening of the record would otherwise be appropriate under the circumstances of this case.

DECISION AND ORDER

Taylor, Judge:

Background

The above-captioned cases were consolidated by an order of former Chief Judge David H. Harris, dated May 30, 1978. Hearings were conducted at Columbus, Ohio on June 19-22, 1978, and at Washington, D.C. on September 11-13, 1978.

The Complainant's Case Against Miller

Following an inspection of Miller's ceramic manufacturing business in Weedsport, New York, on September 28, 1977, Miller was issued a citation

for a nonserious violation of 29 C.F.R. § 1910.1001(j)(3).[1/] The citation alleges that Miller did not provide, or make available, comprehensive annual medical examinations to employees who were exposed to airborne levels of asbestos on the

> [m]ain floor, wet clay packing area, slip mixing tanks loading platform and elsewhere throughout the plant where talc is unloaded out of bags, handled or is airborne.

During the inspection, Peter Brown, an industrial hygienist employed by the Occupational Safety and Health Administration (OSHA), observed two of Miller's employees mixing and packing wet clay in Miller's "wet clay area." (Tr. 2: 153, 163-164.) The employees, Ron Moradorf and George Baker, were using talc from 50-pound bags of Nytal 100HR bearing the name of R. T. Vanderbilt Company as the manufacturer. (Tr. 1: 39; 2: 164, 190-191. Item 43, Respondent's Third Request for Admissions.) Brown observed dust as the bags were poured into the mixing tank. (Tr. 2: 164.) Thereafter, Brown obtained six air filter samples from the breathing zones of each of the two employees over a period of 7-1/2 hours. (Tr. 2: 165, 173, 175.) Brown also obtained a bulk sample from one of the bags of Vanderbilt talc. (Tr. 2: 178.) Both Moradorf and Baker told Brown that they had not received any medical examinations while working for Miller. (Tr. 2: 189-190.) Moradorf

---

1/ This health standard provides that:

> On or before January 31, 1973, and at least annually thereafter, every employer shall provide, or make available, comprehensive medical examinations to each of his employees engaged in occupations exposed to airborne concentrations of asbestos fibers. Such annual examination shall include, as a minimum, a chest roentgenogram . . . , a history to elicit symptomatology of respiratory disease, and pulmonary function tests to include forced vital capacity . . . and forced expiratory volume at 1 second. . . .

told Brown that he had been working for Miller for 2-1/2 years, and Baker told him that he had been employed by Miller for three months. (Tr. 2: 190-191.)

Brown forwarded all of the samples to OSHA's Salt Lake City laboratory for analysis. (Tr. 2: 180.) The laboratory assigned the following identifying numbers: bulk sample, A-6393; Baker air filter samples, A-6395 through A-6400; Moradorf air filter samples, A-6402 through A-6407. (Tr. 2: 182; Exh. C-9.)

Using phase contrast microscopy, dispersion staining, and related petrographic techniques to analyze a portion of bulk sample A-6393, Willard Dixon, an industrial hygienist employed by OSHA's Salt Lake City laboratory, concluded that two anthophyllite fibers,[2/] four tremolite fibers, and 10 fibers of either tremolite or anthophyllite were present. (Tr. 4: 644, 674, 696-699; Exh. C-21.) The remainder of the sample was sent for further analysis to Ian Stewart, the manager of the electron optics group of Walter C. McCrone Associates, Incorporated. (Tr. 2: 317, 4: 699-700; Exh. C-22.) Using transmission electron microscopy and related techniques, Stewart ascertained that more than two fibers of anthophyllite were present in the portion of the sample that he analyzed. (Tr. 5: 52-53, 121-122.)

Daryl Peterson, a physical science technician at OSHA's Salt Lake City laboratory, analyzed the 12 air filter samples obtained by Brown. (Tr. 4: 734, 7: 737; Exh. C-10.) Using dispersion staining on a slide prepared from sample A-6395, Peterson found six fibers of the tremolite-actinolite series. (Tr. 4: 739, 746; Exh. C-23.) At the request of Dixon, Peterson did another analysis

---

2/ As used in this decision, the term "fiber" means a particle that is longer than five micrometers (29 C.F.R. § 1910.1001(a)(2)), and that has an aspect ratio of at least three to one, that is, a particle whose length is at least three times greater than its width. (Para. 1.3, Exh. R-8.) See Borg-Warner Corp., 78 OSAHRC 18/A2 (No. 10757, 1978).

on A-6395, either with the same or a different slide, and detected at least 10 asbestos fibers. (Tr. 4: 747, 750; Exh. C-23.) On examining a portion of A-6396 using dispersion staining, Peterson observed 11 tremolite-actinolite fibers and one anthophyllite fiber. (Tr. 4: 748; Exh. C-23.) Using the same procedure on a part of A-6397, he ascertained that 11 tremolite-actinolite and six anthophyllite fibers were present. (Tr. 4: 749; Exh. C-23.) With dispersion staining, he found seven tremolite fibers and three anthophyllite fibers in the portion of A-6405 that was analyzed. (Tr. 4: 753; Exh. C-23.) He did "just routine phase contrast counting for total number of fibers present" on specimens from the remaining samples. (Tr. 4: 750; Exh. C-23.)

Stewart performed transmission electron microscopy on samples A-6404 and A-6405. (Tr. 5: 118.) His analysis of A-6404 reflected no asbestos fibers greater than five micrometers long. (Tr. 5: 118.) On analyzing A-6405, Stewart identified 20 to 30 anthophyllite fibers. (Tr. 5: 121.)

The Complainant's Case Against Hull

Hull, a manufacturer of pottery tableware, was inspected by Donald Cagle, an industrial hygienist employed by OSHA, during the period September 20-21, 1977. (Tr. 2: 209, 211.) As a result of the inspection, Hull was issued a citation for three nonserious violations. Item 1 of the citation alleges that Hull violated 29 C.F.R. § 1910.1001(c)(2)(i)[3/] in that spilled Ceramitalc HDT was dry swept in Hull's raw material storage area. Item 2

---

3/ Section 1910.1001(c)(2)(i) provides that:

> Insofar as practicable, asbestos shall be handled, mixed, applied, removed, cut, scored, or otherwise worked in a wet state sufficient to prevent the emission of airborne fibers in excess of the exposure limits prescribed in paragraph (b) of this section, unless the usefulness of the product would be diminished thereby.

See footnote 4, infra, for the pertinent contents of § 1910.1001(b).

avers that Hull violated 29 C.F.R. § 1910.1001(g)(2)(i)[4/] by not having caution labels affixed "[o]n the pallets and/or bags of Ceramitalc HDT prior to dumping in the clay mixer." Item 3 alleges that Hull failed to comply with 29 C.F.R. § 1910.1001(h)(2)[5/] in that empty Ceramitalc HDT bags were not disposed of in impermeable containers.

---

4/ Section 1910.1001(g)(2)(i) provides that:

> Caution labels shall be affixed to all raw materials, mixtures, scrap, waste, debris, and other products containing asbestos fibers, or to their containers, except that no label is required where asbestos fibers have been modified by a bonding agent, coating, binder, or other material so that during any reasonably foreseeable use handling, storage, disposal, processing, or transportation, no airborne concentrations of asbestos fibers in excess of the exposure limits prescribed in paragraph (b) of this section will be released.

Paragraph (b) of § 1910.1001 contains the following pertinent requirements:

> (2) Standard effective July 1, 1976. The 8-hour time-weighted average airborne concentrations of asbestos fibers to which any employee may be exposed shall not exceed two fibers, longer than 5 micrometers, per cubic centimeter of air. . . .
>
> (3) Ceiling concentration. No employee shall be exposed at any time to airborne concentrations of asbestos fibers in excess of 10 fibers, longer than 5 micrometers, per cubic centimeter of air. . . .

5/ Section 1910.1001(h)(2) provides that:

> Asbestos waste, scrap, debris, bags, containers, equipment, and asbestos-contaminated clothing, consigned for disposal, which may produce in any reasonably foreseeable use, handling, storage, processing, disposal, or transportation airborne concentrations of asbestos fibers in excess of the exposure limits prescribed in paragraph (b) of this section shall be collected and disposed of in sealed impermeable bags, or other closed, impermeable containers.

See footnote 4, supra, for the pertinent contents of § 1910.1001(b).

During his inspection, Cagle observed the activities of one of Hull's clay mixers and his helper. (Tr. 2: 216.) He saw the clay mixer cutting 50-pound bags of Ceramitalc HDT, dumping them into a mixing machine hopper, and operating the controls that fed water into the mixing machine. (Tr. 2: 216-217.) He also saw the clay mixer using a forklift in moving pallets of the material to the mixing machine. (Tr. 2: 217.) Cagle testified that from what he recalled the bags indicated that the talc was manufactured by the American Talc Company. (Tr. 2: 234.) Apparently, Cagle was mistaken and the talc was manufactured by the International Talc Company, a subsidiary of the R. T. Vanderbilt Company.[6/] (Tr. 2: 265-268.) Cagle observed the helper cutting clay that extruded from the mixing machine and stacking the extruded clay on a cart. (Tr. 2: 217-218.)

Neither the bags of Ceramitalc HDT nor the pallets on which they were stored had any caution labels on them. (Tr. 2: 234.) When the bags of Ceramitalc HDT were emptied, they were not disposed of in impermeable containers, rather the clay mixer simply threw them behind him and they were later placed in an open trash receptacle. (Tr. 2: 234-235.) Cagle observed broom marks where dry material was on the floor in the area where the Ceramitalc HDT was stored. Hull's management officer told Cagle that a broom was used for sweeping and that they "couldn't wet the material . . . because it would be slippery." (Tr. 2: 233.)

Cagle obtained three air filter samples from the breathing zone of the clay mixer and two from the breathing zone of his helper. (Tr. 2: 222-223.) Cagle also took six bulk samples. (Tr. 2: 226.) Cagle forwarded all of the samples to OSHA's Salt Lake City laboratory where they were assigned laboratory numbers and analyzed. (Tr. 2: 227, 229, 232.) The samples from

---

6/ Ceramitalc HDT is a trade name that is registered by the R. T. Vanderbilt Company. (Tr. 2: 267.)

the clay mixer were assigned laboratory numbers A-6236, A-6238, and A-6244. (Exh. C-11.) The ones from the helper were given laboratory numbers A-6237, and A-6245. (Exh. C-11.) Cagle took one of the bulk samples, laboratory number A-6239, from a bag of Ceramitalc HDT that had just been opened by the clay mixer. (Tr. 2: 226, 230; Exh. C-11.) He took four of the bulk samples, laboratory numbers A-6240 through A-6243, from dust that had settled on the floor. (Tr. 2: 227, 231; Exh. C-11.) A-6240 was taken at the base of some steps, about 15 feet from the helper's location at the mixing machine. A-6241 was taken near a post, about 15 feet from the clay mixer. (Tr. 2: 253, 3: 619: Exh. C-11.) A-6242 was obtained in the immediate vicinity of where the clay mixer worked at the machine. (Tr. 2: 254, 3: 619; Exh. C-11.) A-6243 was obtained at the location where the Ceramitalc HDT was stored, about 30 feet from where the clay mixer poured the bags into the machine. (Tr. 2: 251, 3: 619; Exh. C-11.) On Hull's request at the end of the inspection, Cagle took the sixth bulk sample from a torn bag of Westex Black Talc. (Tr. 2: 226, 253.) That talc, which was not being used, was located in another part of Hull's plant. (Tr. 2: 253.) The laboratory number of that sample is A-6246. (Tr. 2: 230-231; Exh. C-11.)

Dan Crane, a physical science technician at OSHA's Salt Lake City laboratory, analyzed the samples obtained by Cagle. (Tr. 2: 333, 3: 535.) Using phase contrast microscopy and related techniques, Crane found a number of fibers in filter samples A-6236, A-6237, A-6238, A-6244, and A-6245. (Tr. 3: 559-562; Exh. C-18.) However, except for sample A-6238, he did not analyze these samples by dispersion staining to ascertain the mineralogical content of these fibers. (Tr. 3: 587, 597, 613-614; Exh. C-18.) Crane's analyses by dispersion staining of three slides prepared from A-6238 revealed the presence of six tremolite or anthophyllite fibers. (Tr. 3: 597; Exh. C-18.) Using dispersion staining on eight slides prepared from bulk

sample A-6239 and four slides prepared from each of the bulk samples identified as A-6241, A-6242, and A-6243, he ascertained that the A-6239 specimens contained 79 fibers that were tremolite or anthophyllite, the A-6241 specimens contained 10 tremolite and two anthophyllite fibers, the A-6242 specimens contained seven fibers that were tremolite or anthophyllite, and the A-6243 specimens contained 34 asbestos fibers. (Tr. 3: 537-548, 551-554, 558; Exh. C-18.) Crane's analysis of bulk sample A-6240 indicated that no fibers were present. (Tr. 3: 550.) Similarly, he detected no asbestos in his analysis of the Westex bulk sample, A-6246. (Tr. 3: 559.)

Subsequently, Ian Stewart performed dispersion staining on bulk samples A-6239, A-6242, and A-6243 and found about 2 to 3 percent fibrous tremolite-actinolite present in A-6239 and A-6243 and "probably less than about 1/4 per cent in A-6242." (Tr. 5: 47, 49.) He also analyzed these samples using transmission electron microscopy. As a result, he identified four anthophyllite fibers in A-6239. (Tr. 5: 105.) Although he saw fibers in A-6242, he could not positively identify them as asbestos. (Tr. 5: 106-107, 109.) By electron microscopic examination of A-6243, Stewart found that A-6243 was substantially similar to A-6239 in that anthophyllite fibers were present in A-6243. (Tr. 5: 107-109.)

## The Complainant's Case Against Baldwin

Baldwin, a paint manufacturer, was inspected by David Barnhill, an OSHA industrial hygienist, during the period June 28-30, 1977, and by Sally Barber, another OSHA industrial hygienist, on October 6 and 11, 1977. (Tr. 3: 620-621; 2: 269, 272.) Following these inspections, Baldwin was issued, on January 17, 1978, a citation for four nonserious violations, which is

designated as Citation Number 2.[7/] Item 1 of the citation alleges that Baldwin's paint mixing area had not been monitored to determine whether the paint mixers were exposed to excessive levels of asbestos fibers as required by 29 C.F.R. § 1910.1001(f)(1).[8/] Item 2 avers that Baldwin violated 29 C.F.R. § 1910.1001(g)(2)(i)[9/] in that raw materials being used in the paint mixing area did not contain caution labels. Items 3 and 4 allege that Baldwin violated 29 C.F.R. § 1910.1001(j)(2)[10/] and (3),[11/] respectively, by not providing employees working in the paint mixing area with preplacement and annual medical examinations as required by these two standards.

---

7/ The file in the Baldwin case also contains a citation for a nonserious violation of 29 C.F.R. § 1910.132(a). That citation, designated as Citation Number 1 and issued on October 31, 1977, was not contested by Baldwin and has become a final order of the Commission by operation of law. (Tr. 1: 7.) See 29 U.S.C. § 659(a).

8/ This health standard provides, in pertinent part, that:

> Within 6 months of the publication of this section, every employer shall cause every place of employment where asbestos fibers are released to be monitored in such a way as to determine whether every employee's exposure to asbestos fibers is below the limits prescribed in paragraph (b) of this section.

9/ See footnote 4, supra, for the text of this standard.

10/ Section 1910.1001(j)(2) provides the following as to preplacement medical examinations:

> The employer shall provide or make available to each of his employees, within 30 calendar days following his first employment in an occupation exposed to airborne concentrations of asbestos fibers, a comprehensive medical examination, which shall include, as a minimum, a chest roentgenogram . . . , a history to elicit symptomatology of respiratory disease, and pulmonary function tests to include forced vital capacity . . . and forced expiratory volume at 1 second. . . .

11/ See footnote 1, supra, for text of 29 C.F.R. § 1910.1001(j)(3), the annual medical examination standard.

During his inspection, Barnhill met Baldwin's president, Mr. Carneal. (Tr. 3: 455, 622.) Carneal told Barnhill that the R. T. Vanderbilt talcs used by Baldwin did not contain asbestos and showed Barnhill some letters from Vanderbilt indicating that the talcs did not contain asbestos. (Tr. 3: 628.) Carneal also told Barnhill that Baldwin's employees had not been given any type of physical examination and that Baldwin had done no monitoring "for lead or silica or talc, or any compound." (Tr. 3: 628-630.) Barnhill obtained a bulk sample from a 50-pound bag of Nytal 200 that was being used in Baldwin's plant. (Tr. 3: 626, 629, 634.) Barnhill saw no asbestos caution labels on the bags of Nytal 200 that he observed. (Tr. 3: 629.) He also testified that he had no knowledge as to how long Baldwin had been using Nytal 200. (Tr. 3: 632.)

The bulk sample of Nytal 200 was sent to OSHA's Salt Lake City laboratory, where it was assigned laboratory number A-4976 and analyzed by Willard Dixon. (Tr. 3: 631, 4: 668; Exh. C-15.) Initially, in August 1977, Dixon analyzed A-4976 by using dispersion staining and related techniques. (Tr. 4: 668.) By scanning slides prepared from A-4976, he concluded "that asbestos fibers were present in low concentration around one percent or less." (Tr. 4: 669, 678; Exh. C-15.) In May 1978, he performed another analysis on A-4976 using the same petrographic techniques, but taking an actual fiber count on that occasion. (Tr. 4: 679, 681; Exh. C-20.) This analysis indicated the presence of five anthophyllite fibers, 17 tremolite fibers, and 19 fibers that were either anthophyllite or tremolite fibers. (Tr. 4: 688-691.)

Ian Stewart subsequently analyzed A-4976 using dispersion staining and found 3 to 5 per cent by weight of fibrous tremolite-actinolite. (Tr. 5: 47-49.) His electron microscopic examination of that sample indicated the presence of anthophyllite fibers. (Tr. 5: 116.)

During her inspection, Barber observed two of the respondent's paint mixers pouring talc and other dry materials into a paint mixing vat. (Tr. 2:

280-281.) The talc was in 50-pound bags of Nytal 200 manufactured by R. T. Vanderbilt. (Tr. 2: 281, 3: 453-454.) The bags had no caution labels on them to indicate that they contained asbestos material. (Tr. 2: 300.) Carneal told Barber that Baldwin had not performed any initial monitoring for the presence of asbestos and that Baldwin's employees had not been given any physical examinations. (Tr. 2: 300-301.) Barber did not know how long Baldwin had been in business or how long Baldwin had been using Nytal 200. (Tr. 2: 314, 3: 454-455.) One of the paint mixers told Barber that he had worked for Baldwin for one year. The other employee told her that he had worked for Baldwin for three months. (Tr. 3: 457.) Barber obtained five air filter samples from the breathing zones of each of the paint mixers. (Tr. 2: 280, 282, 287.) These samples were sent to OSHA's Salt Lake City laboratory where they were assigned laboratory numbers A-7015 through A-7024. (Tr. 2: 290-292, Exh. C-13.)

The samples were analyzed by Dan Crane. (Tr. 3: 465; Exh. C-14.) Using phase contrast microscopy and related techniques, he found a number of fibers in his analysis of all the samples except A-7021, which was unacceptable for analysis. (Tr. 3: 465, 512-515, 591; Exhs. C-14, C-17.) In addition, he performed dispersion staining on a part of A-7016 and ascertained that 10 asbestos fibers, either tremolite or anthophyllite, were present. (Tr. 3: 518, 529-531; Exh. C.-17.) Subsequently, by electron microscopic analysis of a portion of A-7016, Stewart identified two anthophyllite fibers and a large bundle of fibers that were comprised of anthophyllite fibers and what he believed to be chrysotile fibers. (Tr. 5: 110-112, 115-116.)

## The Case for the Respondents

Dr. Ann Wylie testified for the respondents as an expert witness on mineralogy and light microscopy. (Tr. 6: 51.) Randall Ross testified for the respondents as an expert witness on electron microscopy, electron

diffraction, and energy dispersion analysis. (Tr. 6: 148-149, 7: 4.) The gist of their testimony is that the analytical techniques used by the Salt Lake City laboratory technicians and by Ian Stewart were inadequate to establish the presence of asbestos fibers.

Wylie testified that the Salt Lake City laboratory personnel did not perform all of the steps she would have used in analyzing the samples. (Tr. 6: 131.) She would have used the ten step procedure described in Exhibit R-30 if she received a sample for analysis that she did not know anything about. (Tr. 6: 52-54, 59.) When asked if she would follow all of these steps if she were asked to analyze a sample for the six asbestos minerals enumerated in 29 C.F.R. § 1910.1001(a)(1), that is, chrysotile, amosite, crocidolite, tremolite, anthophyllite, and actinolite, she answered as follows:

> Yes, I would, unless I knew, for example, exactly the locality it came from and what minerals were there to start with, or if I had some previous knowledge about the sample that I could eliminate a large group of minerals for some reason.
>
> Then perhaps maybe it wouldn't be necessary to go through them all. But without a lot of knowledge, previous knowledge, I wouldn't, I couldn't identify without going through those steps, no. (Tr. 6: 62-63.)

In her opinion, the Salt Lake City analyses were inadequate to identify the minerals in the samples unless there was prior knowledge of the mineral content of the samples. She would have run an x-ray diffraction on the bulk samples. (Tr. 6: 64.)

Wylie stated it was difficult to distinguish tremolite, tourmaline, and prehnite by dispersion staining and that richterite cannot be distinguished from tremolite optically. (Tr. 6: 68-69.) However, tremolite can be distinguished from pectolite and wollastonite by dispersion staining if care is used. (Tr. 6: 70-71.)

Relying on various publications, Wylie testified that tremolite, anthophyllite, and actinolite exist in both asbestiform and nonasbestiform. (Tr. 6: 79-87; Exhs. R-25, R-33.) She explained that from a mineralogical viewpoint a true asbestos fiber is one that grows as a fiber in nature, whereas a cleavage fragment is a fragment that is broken from a larger particle. (Tr. 6: 89, 127.) Using Exhibit R-32, she pointed out illustrations of fibers and cleavage fragments. (Tr. 6: 90-94.) Although she had not heard that a cleavage fragment presents a health hazard, such a fragment would be classified as an asbestos fiber under the OSHA definition if it contained one of the six minerals enumerated in 29 C.F.R. § 1910.1001(a)(1), was longer than five micrometers, and had an aspect ratio of at least three to one.[12/] (Tr. 6: 93-94, 102.) However, it should not be classified as an asbestiform mineral because it didn't "grow as asbestos." (Tr. 6: 127.) In Wylie's opinion, "[a] particle three times longer than it is wide is not a fiber" from a mineralogical standpoint. (Tr. 6: 94-95.) Her study of asbestos, under a grant from the Bureau of Mines, shows that

> for particles longer than five micrometers, about 99 percent of all asbestos fibers have an aspect ratio of about ten to one, and more than half have an aspect ratio in excess of 50 to one. (Tr. 6: 96.)

In analyzing a massive variety of tremolite that was crushed, she found that only five percent of the particles had aspect ratios in excess of ten to one and none were in excess of 50 to 1. (Tr. 6: 96-97.)

Ross testified as to the importance of having appropriate internal standards in analyzing material by electron microscopic techniques. (Tr. 7: 4-6, 17-18.) He also testifed as to the need to have a tilting capacity on the microscope used in such an analysis. (Tr. 7: 6-17, 19-22.)

---

12/ See footnote 2, supra.

Ross reviewed Exhibits C-31A-F (Tr. 7: 26), consisting of six photographs of the anthophyllite standards that were used by Stewart in performing his analyses. (Tr. 5: 57.) Ross also reviewed Exhibits C-26, C-27, and C-28, which are illustrations of the techniques used by Stewart in analyzing various samples. (Tr. 5: 81, 83-84, 94, 95; 7: 35-45.) Having made a visual observation of Exhibits C-31A-F and having made various measurements on them, Ross concluded that Stewart had used a poor anthophyllite standard. (Tr. 7: 26-32.) However, Ross also indicated that his opinion might be influenced by deviations resulting from the photographic process and that he would like to see the negatives. (Tr. 7: 32-33.)

Ross stated that Stewart's failure to count the angstrom spacings between the layer lines on the diffraction patterns was generally unacceptable. (Tr. 7: 36.) In Ross's opinion, Exhibit C-27P (fiber bundle, Baldwin, A-7016) and the diffraction patterns shown in the following exhibits were of little or no value for identifying asbestos fibers: C-26Q (Miller, A-6405); C-27N (fiber 1, Baldwin, A-7016); C-27O (fiber 2, Baldwin, A-7016); C-27Q (fiber bundle, Baldwin, A-7016); C-28E (fiber 2, Hull, A-6239); C-28G (fiber 3, Hull, A-6239); C-28K (fiber 4, Hull, A-6239). (Tr. 7: 35-45.) Ross qualified his opinions as to these exhibits by the reservation "that there is a question in the translation . . . from the negative to the print" because deviations might have been introduced by normal photographic procedures. (Tr. 7: 63.) Accordingly, Ross "put in a very strong request to see the original data." (Tr. 7: 65.)

Ross also criticized Stewart's analyses where no photographs were taken because Stewart "merely eyeballed the diffraction pattern and concluded that he had found an amphibole." (Tr. 7: 45.) Ross further pointed out that in an energy dispersive analysis there is a better chance of getting a pure chemical sample, uncontaminated by surrounding

interference particles, by using a selected point method rather than the "elongated concept" used by Stewart. (Tr. 7: 48.)

Findings of Facts in the Miller Case

1. On September 28, 1977, at Miller's plant located in Weedsport, New York, two of Miller's employees, Ron Moradorf and George Baker, were exposed to airborne concentrations of at least two asbestos fibers.

2. Moradorf and Baker had worked for Miller for 2-1/2 years and three months, respectively, and no medical examinations had been provided, or made available, to them.

3. The evidence fails to establish how long Miller had been using Nytal 100HR.

4. The evidence fails to establish that Miller possessed actual or constructive knowledge that Nytal 100HR contained asbestos.

Findings of Fact in the Hull Case

1. On or about September 21, 1977, at Hull's plant located in Crooksville, Ohio, spilled Ceramitalc HDT was dry swept in the vicinity of the raw material storage area, asbestos caution labels were not affixed to the bags of Ceramitalc HDT or the pallets on which they were stored, and empty Ceramitalc HDT bags were not collected or disposed of in sealed, impermeable bags or other closed, impermeable containers.

2. The evidence fails to establish that it was reasonably foreseeable that the failure to collect and dispose of the empty Ceramitalc HDT bags in impermeable bags or impermeable containers could have resulted in the exposure of Hull's employees to airborne concentrations of asbestos fibers in excess of those specified in 29 C.F.R. § 1910.1001(b)(2) or (3).[13/] Similarly, there is no evidence that the dry sweeping of spilled Ceramitalc HDT would

---

13/ See footnote 4, supra, for the text of 29 C.F.R. § 1910.1001(b)(2) and (3).

exceed the limits provided in § 1910.1001(b)(2) or (3). However, the evidence establishes that some of the Ceramitalc HDT being used by Hull's employees contained at least two asbestos fibers.

3. The evidence fails to establish that Hull possessed actual or constructive knowledge that Ceramitalc HDT contained asbestos.

Findings of Facts in the Baldwin Case

1. From about June 30, 1977, to October 11, 1977, at Baldwin's plant in Foley, Alabama, Nytal 200 was used by Baldwin's employees while mixing paint. However, the evidence fails to establish that Nytal 200 was used by Baldwin for any additional period of time.

2. Baldwin had not performed any initial monitoring for the presence of asbestos and had not provided, or made available, medical examinations for its employees.

3. Asbestos caution labels were not affixed to the bags of Nytal 200 used by Baldwin's employees.

4. The evidence fails to establish that any employee who worked with Nytal 200 had been employed by Baldwin for as long as one year. It does establish, however, that two such employees, paint mixers, had been employed by Baldwin for more than 30 days.

5. The evidence establishes that the two paint mixers were exposed to airborne concentrations of at least two asbestos fibers each and that these fibers were released by the Nytal 200 that they were using.

6. The evidence fails to establish that Baldwin possessed actual or constructive knowledge that Nytal 200 contained asbestos.

Discussion

Prior to trial, the respondents filed a motion to dismiss all citations because the asbestos standards were improperly promulgated and unenforceably vague. The motion also asserts "that Complainant's continued

enforcement of an unconstitutional and unenforceably vague standard is arbitrary, capricious and constitutes an abuse of direction." The respondent's motion was considered and denied at trial. (Tr. 1: 28-37, 42-52.) In a joint post-trial brief, the respondents and the intervenor ask that I reconsider my denial of the motion. I adhere to my ruling for the reasons stated at trial. In addition, see the discussion of the dichotomy pertaining to the "asbestiform" and so-called "nonasbestiform" of minerals, infra. Also see National Industrial Constructors, Inc. v. OSHRC, 583 F.2d 1048, 1052-53 (8th Cir. 1978.)

Since I found at trial that the asbestos standards were not improperly promulgated or unenforceably vague, it was unnecessary for me to address the assertion that the complainant's enforcement of the standards was arbitrary, capricious, and an abuse of discretion. The joint post-trial brief asserts, however, that "the asbestos standard . . . is arbitrary and capricious." This assertion relates to the wisdom of the asbestos standards. The Commission has held that it is not its function to address the wisdom of the standard. Borg-Warner Corporation, 78 OSAHRC 18/A2 n. 11 (No. 10757, 1978.) Nevertheless, to alleviate possible appellate problems that could result from the absence of a ruling, I conclude that the evidence does not show that the asbestos standards are arbitrary and capricious.

Annual medical examinations are required under 29 C.F.R. § 1910.1001(j)(3) when employees are exposed to airborne concentrations of asbestos, regardless of the levels of exposure. GAF Corp. 75 OSAHRC 3/A2 (No. 3203, 1975), aff'd, 561 F.2d 913 (D.C. Cir. 1977.) However, since §1910.1001(j)(3) applies to employees engaged in occupations exposed to airborne concentrations of asbestos "fibers," I conclude that the standard applies to situations where employees are exposed to airborne

concentrations of at least two asbestos fibers, or will be in the future. See Gilles & Cotting, Inc., 76 OSAHRC 30/D9 (No. 504, 1976.) In these respects, I interpret the requirements for preplacement medical examinations in 29 C.F.R. § 1910.1001(j)(2) to be the same as those in § 1910.1001(j)(3) because the significant language in both standards is identical.[14/]

The evidence establishes that two of Miller's employees, Moradorf and Baker, were exposed to airborne concentrations of at least two asbestos fibers. Dust was observed in the air when bags were poured into the mixing tank. Dixon's analysis of the bulk sample (A-6393) revealed the presence of two anthophyllite fibers, four tremolite fibers, and 10 fibers of either tremolite or anthophyllite. The presence of asbestos fibers in this sample was verified by Stewart whose analysis indicated that more than two

---

14/ In their joint post-trial brief, the respondents and the intervenor contend that the medical examination standards are unenforceably vague. In support of this contention they assert that evidence adduced at trial (Tr. 3: 415-425) shows an "unofficial exclusion level 'policy' in certain OSHA offices" providing "that concentrations of .1 asbestos fibers per cubic centimeter of air or greater must be found before any citation under the medical examination provisions would be issued." In this connection, I am asked to take official notice of OSHA Program Directive Number 300-16 issued on October 11, 1978, which, in effect, formally announces this policy. At best, the matters referred to in the joint post-trial brief merely show that the complainant has changed his interpretation of the standards for enforcement purposes. See GAF Corp. v. OSHRC, 561 F.2d.913 (D.C. Cir., 1977). They do not detract from the specificity of the standards as promulgated by the complainant and as interpreted by the Commission and the United States Court of Appeals for the District of Columbia Circuit. Furthermore, the implementation or pronouncement of policies by the Secretary of Labor or his representatives have no binding legal effect on either the Secretary or the Commission when they have not been promulgated as rules on regulations. See Bristol-Myers Co., 78 OSAHRC 106/D13 n.1 (No. 77-3854, 1978); Alfred S. Austin Construction Co., 76 OSAHRC 50/A2 (No. 4809, 1976); GAF Corp.,77 OSAHRC 207/E6 (No. 77-616, 1977) (Alfieri, J. ). Of course, Policy Directive Number 300-16, is also not binding here because it was not issued until well after the issuance of the citations in the instant cases.

anthophyllite fibers were present.[15/] Peterson's analysis of A-6405, an air filter sample taken on Moradorf, showed that seven tremolite and three anthophyllite fibers were present. The presence of asbestos fibers in this sample was also verified by Stewart who observed 20 to 30 anthophyllite fibers in a portion of the sample.

Irrespective of the exposure of Moradorf and Baker to asbestos fibers, the evidence is insufficient to establish that Miller violated 29 C.F.R. § 1910.1001(j)(3). Baker had worked for Miller for only three months. More important, there is no evidence as to how long Miller had been using Nytal 100HR. Thus, it cannot be said that Miller had failed to provide Moradorf or Baker with the annual medical examinations required by § 1910.1001(j)(3). Similarly, the failure to establish how long Miller had been using Nytal 100HR precludes amending the citation and finding a violation of 29 C.F.R. § 1910.1001(j)(2), for a failure to provide preplacement medical examinations.

The evidence establishes that Baldwin's paint mixers were exposed to airborne concentrations of at least two asbestos fibers. This is established by Crane's and Stewart's analyses of air filter sample A-7016. Additionally, Dixon's and Stewart's analyses of the bulk sample obtained by Barnhill (A-4976) show that asbestos fibers were present in that sample. However, as in the Miller case, a violation of 29 C.F.R. § 1910.1001(j)(3) has not been established as the evidence fails to show that either of the paint mixers had

---

15/ Stewart testified that analysis by transmission electron microscopy and related techniques was necessary to rule out the possibility of erroneously counting talc fibers as asbestos fibers, which could not be accomplished by the analysis techniques used by OSHA's Salt Lake City laboratory. (Tr. 5: 53.) Accordingly, athough I note that Peterson found asbestos fibers in A-6395, A-6396, and A-6397, I do not rely on those analyses in concluding that Moradorf and Baker were exposed to airborne concentrations of at least two asbestos fibers as Peterson's findings were not verified by Stewart. Also, I do not rely in this decision on other OSHA analyses that have not been verified by Stewart.

been working for Baldwin for a year[16] or that they had been using Nytal 200 for a year in their work.

Barber's testimony establishes that both paint mixers had worked for Baldwin for more than 30 days. Her testimony coupled with that of Barnhill shows that Baldwin had been using Nytal 200 for slightly more than three months between June 1977 and October 1977,[17] well over the 30 calendar days specified in the preplacement medical examination standard, 29 C.F.R. § 1910.1001(j)(2).

Asbestos caution labels must be affixed to products containing asbestos "fibers." 29 C.F.R. § 1910.1001(g)(2)(i). As with the medical examination standards, I conclude that caution labels are required when a product contains at least two asbestos fibers.[18] As previously indicated,

---

16/ Barber testified that one of the employees told her that he had worked for Baldwin for three months. As she "recall[ed]" the other indicated to her that he had worked for Baldwin for one year. (Tr. 3: 457.) I consider this to be a rough approximation that could have fell short of being a full year. Accordingly, I find that Barber's testimony is not sufficiently definitive to establish that the employee had worked for Baldwin for a year.

17/ No violation can be found on the date of Barnhill's inspection because the citation was not issued to Baldwin within six months after Barnhill's inspection. 29 U.S.C. § 658(c). Nevertheless, Barnhill's testimony can be used in part to establish the existence of violations at the time of Barber's inspection. For example, Barnhill's testimony can be used to establish that Baldwin was using Nytal 200 at the time of Barnhill's inspection. Furthermore, the bulk sample obtained by Barnhill can be used to show that the Nytal 200 in use at the time of Barnhill's inspection contained asbestos fibers.

18/ To establish a violation of 29 C.F.R. § 1910.1001(g)(2)(i), the complainant is not required to prove "that during any reasonably foreseeable use, handling, storage, disposal, processing, or transportation, no airborne concentrations of asbestos fibers in excess of the exposure limits prescribed in [29 C.F.R. § 1910.1001(b)] will be released." That requirement pertains only to a situation "where asbestos fibers have been modified by a bonding agent, coating, binder, or other material," which is not the situation in the Baldwin and Hull cases.

the presence of at least two asbestos fibers in the Nytal 200 used by Baldwin is established by Crane's, Dixon's, and Stewart's analyses of A-7016 and A-4976. Barber's testimony shows that the bags of Nytal 200 that she observed at the respondent's plant did not have asbestos caution labels.

Cagle's testimony establishes that neither the bags of Ceramitalc HDT used by Hull nor the pallets on which they were stored had asbestos caution labels. The presence of at least two asbestos fibers in the Ceramitalc HDT used by Hull is established by Crane's and Stewart's analyses of bulk sample A-6239 taken from a bag of Ceramitalc HDT and of bulk sample A-6243 taken from the floor in the area where the Ceramitalc HDT was stored.[19/]

Under 29 C.F.R. § 1910.1001(c)(2)(i) asbestos must be handled or worked in a wet state sufficient to prevent the emission of airborne fibers in excess of the exposure limits specified in 29 C.F.R. § 1910.1001(b)(2) and (3). Obviously, this presupposes that when handled or worked in the dry state there would be an emission of airborne asbestos fibers in excess of the § 1910.1001(b)(2) and (3) limits. There is no evidence that the dry sweeping of spilled Ceramitalc HDT would exceed these limits in Hull's plant.

Hull's empty Ceramitalc HDT bags should have been collected and disposed of in impermeable containers if it was "reasonably foreseeable" that their future use or processing might produce airborne concentrations of asbestos fibers in excess of the limits prescribed in § 1910.1001(b)(2) and (3). There is no evidence to establish that it was reasonably foreseeable from Hull's use or other processing of these empty bags that these limits might be exceeded.

---

19/ Crane also found asbestos fibers in air filter sample A-6238 and in bulk samples A-6241 and A-6242. Stewart did not analyze A-6238 or A-6241 and could not identify asbestos in A-6242. Therefore, I do not rely on Crane's analyses of these samples. See footnote 15, supra.

The asbestos monitoring standard, 29 C.F.R. § 1910.1001(f)(1) requires monitoring, "[w]ithin 6 months of the publication of this section," of places of employment when asbestos "fibers" are released. Therefore, to establish a violation of this standard, it must be shown that at least two asbestos fibers were actually released from the Nytal 200 being used at Baldwin's plant. See Goodyear Tire & Rubber Company, 77 OSAHRC 82/A2 (No. 13442, 1977.) This is established by Crane's and Stewart's analyses of air filter sample A-7016. The fact that Baldwin had done no initial monitoring for asbestos is established by Carneal's admission to Barber that none had been done.

In my opinion, if an employer should have monitored for asbestos within six months of the publication of 29 C.F.R. § 1910.93(a),[20/] his duty to monitor continues as long as he continues to use products that release asbestos fibers. See Yelvington Welding Services, 78 OSAHRC 84/D6 (No. 15958, 1978). Also, I interpret the standard to require initial asbestos monitoring within a reasonable time after an employer knows or, by the exercise of reasonable diligence, could have known that a product used by him was causing the release of asbestos fibers in his place of employment, even though he was not using this product during the initial six-month period.[21/] As previously indicated, the evidence establishes that Baldwin had

---

20/ The asbestos standards were previously codified at 29 C.F.R. § 1910.93a and, on May 28, 1975 were recodified at 29 C.F.R. § 1910.1001. 40 Fed. Reg. 23072 (1975).

21/ The conclusions expressed in this paragraph are supported by 29 C.F.R. § 1910.1001(f)(3)(ii), which provides that:

> After the initial determinations required by paragraph (f)(1) of this section, samples shall be of such frequency and pattern as to represent with reasonable accuracy the levels of exposure of the employees. In no case shall sampling be at intervals greater than 6 months for employees whose exposures to asbestos may reasonably be foreseen to exceed the exposure limits prescribed in paragraph (b) of this section.

been using Nytal 200 from the time of the first inspection to the time of the second one, a period of slightly more than three months, but does not establish when Baldwin first started to use Nytal 200. If Baldwin knew at the time of the first inspection or, by the exercise of reasonable diligence, could have known at that time that Nytal 200 contained asbestos fibers, then the time interval between the two inspections would constitute more than a reasonable period for the accomplishment of the required monitoring.

In my opinion, there is no validity to the respondent's attempt, through the testimony of Wylie and Ross, to impeach the analyses of the samples by Stewart and OSHA's Salt Lake City laboratory. Wylie testified that the Salt Lake City analyses were inadequate unless there was prior knowledge of the mineral content of the samples. However, the Salt Lake City laboratory had such knowledge because the analysts could readily identify a Vanderbilt product under a microscope and had prior knowledge of the mineralogical content of Vanderbilt products. (Tr. 4: 713-714, 717-718, 722.) Also see Borg-Warner Corp., 78 OSAHRC 18/A2 (No. 10757, 1978); Wenczel Tile Company of Florida, Inc., OSAHRC Docket No. 77-2039 (August 14, 1978) (Brady, J.), Commission review ordered, September 13, 1978. Moreover, Stewart's verification of several of the Salt Lake City analyses negates Wylie's reservations as to the mineral content of those samples.[22/]

Ross' criticisms of Stewart's analyses were based on photographic exhibits that were introduced by the complainant merely to illustrate the techniques used by Stewart. Ross admitted that his criticisms could be invalid because of possible deviations in the photographs and requested an opportunity to see the original data. At the trial, I ruled that the respondents' experts would be afforded an opportunity to examine this data and that following the examination I would grant a motion to reopen the

---

22/ See footnote 15, supra.

hearing to present evidence as to what the examination revealed. (Tr. 6: 33-34; 7: 80.) The respondents' counsel agreed that he would subsequently advise me as to whether the respondents would avail themselves of the opportunity to have their experts examine the data. (Tr. 7: 77-80.) Thereafter, by a letter dated September 26, 1978, the opportunity was declined. Accordingly, I find that Ross's criticisms are entitled to no significant weight.

The conclusions of the complainant's analysts concerning the mineralogical composition of the fibers they analyzed are supported by Mineral Product Safety Data Sheets prepared by Vanderbilt on May 1, 1975, and January 15, 1978. (Exhs. C-32, C-33.) Those data sheets show that 50 to 70 percent of Ceramitalc HDT and Nytal 100HR and 40 to 60 percent of Nytal 200 is "tremolite and/or anthophyllite," albeit "non-asbestiform."

The Commission has held that the so-called "nonasbestiform" of the minerals regulated by the complainant's asbestos standards fall within the purview of the standards. Borg-Warner Corp., supra. I find nothing in the instant cases that detracts from that holding. Wylie's testimony represents a mineralogical viewpoint as contrasted with the health considerations inherent in the asbestos standards.[23/] Whether the inhalation of tremolite, anthophyllite, and actinolite cleavage fragments[24/] that are longer than five

---

23/ Thus, the term "nonasbestiform" appears to be a misnomer from a health standpoint.

24/ As a matter of practice, OSHA's Salt Lake City laboratory did not count a particle as a fiber if its width was greater than five micrometers. (Tr. 3: 506; 4: 717-718, 741.) This tended to eliminate the counting of a cleavage fragment as a fiber. (Tr. 4: 717.)

micrometers with an aspect ratio of at least three to one[25/] is injurious to an employee's health is unclear from the record in these cases. However, there was no evidence introduced during the trial that tends to show that it is not just as injurious to an employee's health to inhale these particles as it is to inhale particles that differ from them only in that they grow naturally as asbestos fibers.[26/] The resolution of this matter is not essential in these cases because a comparison of photographs of tremolite, anthophyllite, and actinolite cleavage fragments and asbestiform fibers (figures 3, 4, and 5, pages 7, 8, and 9, Exh. R-32) with the illustrative photographs of Stewart's analyses of samples A-6405 (Exh. C-26P), A-7016 (Exhs. C-27M and P), and A-6239 (Exhs. C-28A, C, D, F, H, and J) clearly establishes that the particles analyzed by Stewart were of the asbestiform variety as used in mineralogical parlance. (Tr. 6: 97-99.) More important, the respondents and the intervenor concede at page 26 of their joint post-trial brief that the

---

25/ Although the three to one aspect ratio requirement is not contained in the asbestos standards, it constitutes a subsequent interpretation of the standard by the complainant. See Borg-Warner Corp., supra. Since that interpretation increases the complainant's burden of proof, the respondents cannot be prejuduced by its use. In regard to Wylie's testimony that about all asbestos fibers have an aspect ratio greater than three to one, I note that Stewart testified that he found some asbestos fibers with about a 100 to 1 aspect ratio. (Tr. 5: 96, 194.)

26/ After trial, however, the respondents requested me to take official notice of pages 2 and 3 of DHEW Publication Number (NIH) 79-1681, entitled "Asbestos: An Information Resource," published in May 1978. That publication states that "recent biological studies suggest that, in terms of carcinogenic activity, mineral shape may be more important than chemical nature." However, several studies by the National Institute for Occupational Safety and Health are more relevant to the health hazards associated with the Vanderbilt products involved in the instant cases. These studies show an increased risk of lung cancer among former miners and millers who had worked with tremolitic talcs for the R. T. Vanderbilt Company in upper New York and reveal an elevated prevalence of pleural thickening is nearly one of every three Vanderbilt tremolitic talc workers with greater than 15 years of exposure. (Exh. R-9.)

complainant's photographs "apparently depict mineralogical fibers" and that "[t]he fibrous morphology of the suspect particles is not debated."[27/]

To establish any violation of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678, the complainant must prove that the respondent possessed actual or constructive knowledge of the alleged violative conditions. Wally Taylor Construction Co., 76 OSAHRC 142/F6 (No. 9413, 1976), and the cases cited therein; Scheel Construction, Inc., 76 OSAHRC 138/B6 (No. 8687, 1976). In the instant cases, that equates to a requirement that the complainant prove that the respondents knew or, by the exercise of reasonable diligence, could have known that they were using talcs that contained asbestos fibers. I conclude that the complainant failed to prove that any of the respondents possessed such knowledge.

The complainant attempted to prove that the respondents possessed the requiste knowledge through the testimony of Allen Harvey, the manager

---

27/ DHEW Publication Number (NIH) 79-1681 also indicates the following:

> The identification of asbestos is complex because many of the minerals that are chemically almost identical to different varieties of asbestos (e.g., grunerite to amosite, serpentine to chrysotile) exhibit perfect prismatic cleavage (the ability to break along well-defined crystallographic planes), so that physical degradation often leads to the formation of minute cleavage fragments that are chemically as well as physically indistinguishable from asbestos fibers. Recent comprehensive studies at the U. S. Bureau of Mines have concluded that there is currently no absolute way to distinguish between finely divided asbestos and certain other minerals of similar composition. (Emphasis added.)

Because of their indefiniteness, these conclusions are of little significance in the instant cases. Moreover, for the reasons previously discussed in the text, the evidence establishes the presence of asbestos fibers in various samples of Ceramitalc HDT, Nytal 100HR, and Nytal 200 that were analyzed.

for technical development for the R. T. Vanderbilt Company. (Tr. 7: 81.) Harvey identified an unsigned letter (Exh. C-34) bearing the letterhead of the R. T. Vanderbilt Co., dated January 25, 1977, addressed "To Our Talc Customers," which is entitled "Talc Certification." (Tr. 7: 87.) The body of the letter states the following:

> In a letter from the U. S. Department of Labor, dated October 9, 1974, we were authorized to certify that our talc products do not contain asbestos. This reasonable move was followed by OSHA Field Memorandum #74-92, which attempted to clarify the differences between asbestiform and non-asbestiform minerals.
>
> Dr. Morton Corn, the most recent Assistant Secretary of Labor and head of OSHA, informed us in a letter received January 24, 1977, that this authorization has now been rescinded and the Field Memorandum has been cancelled. These most recent rulings were made just prior to Dr. Corn's resignation and mean we are no longer in a position to certify that our talc products do not contain asbestos even though they are composed of the same non-asbestiform minerals processed the same as always.
>
> We are unable to explain this unwarranted reversal of policy by OSHA, but you can be assured we will actively oppose this injustice with all the technical and legal means available to us. Our talcs have been the subject of two OSHA cases during the past year which have gone to litigation. One case remains unresolved and in the other one the Government backed down from their asbestos contention and accepted a settlement which was not even under the Asbestos Standard.
>
> We thank you for your continued consideration and support.

Although Harvey participated in the preparation of the letter, he was not sure that it had been sent to Vanderbilt's talc customers. (Tr. 7: 88-89.) Even if there was evidence that the letter had been mailed to each of the respondents, I would not infer that it had been received by them. There is, however, some evidence from which it can be inferred that Baldwin received

the letter. Based on letters received from Vanderbilt, Carneal told Barnhill that the Vanderbilt talcs being used by Baldwin "don't have any asbestos in them." (Tr. 3: 628.) Subsequently, Carneal gave Barber a letter from Vanderbilt, dated January 25, 1977, addressed to its talc users, and entitled "Talc Certification." (Tr. 3: 455.)

Vanderbilt's letter of January 25, 1977, shows that Vanderbilt, under an authorization granted by the complainant, had certified to its talc users that Vanderbilt's talcs did not contain asbestos. Although the letter states that the complainant had withdrawn the previously granted certification authority, it continues to tell Vanderbilt talc users that Vanderbilt's talc products do not contain asbestos. In my opinion, it was reasonable for users of Vanderbilt talcs, including those who received the January 25, 1977, letter to rely on Vanderbilt's assertions that its talcs were free of asbestos.[28/] It is clear that Baldwin believed the assertions, and it is reasonably expectable that other users also believed them. It would most certainly be unreasonable to expect every user of Vanderbilt talcs throughout the nation to individually have these talcs analyzed for asbestos after having been told by the producers that the talcs did not contain asbestos.[29/] The difficulties of

---

28/ There is no other evidence which tends to show that the respondents had any cause to believe that Vanderbilt talcs contained asbestos. To the contrary, the Mineral Product Safety Data Sheets prepared by Vanderbilt on May 1, 1975, and January 15, 1978, to inform its customers of the ingredients in Vanderbilt talcs, indicate that no asbestos is contained in Ceramitalc HDT, Nytal 100HR, or Nytal 200, as the tremolite and anthophyllite contained in these talcs are characterized as "non-asbestiform." (Tr. 7: 82-86; Exhs. C-32, C-33.)

29/ In instances such as this, it would seem that enforcement should be initially directed against the producers to require them to affix asbestos labels to their products where appropriate. If users were so alerted to the presence of asbestos, it should obviate the necessity "to litigate numerous similar cases through the administrative and appeal procedure provided" under the Act. Continental Can Co., U.S.A. v. Marshall, 455 F.Supp. 1015 (S. D. Ill., 1978).

obtaining such analyses are well demonstrated by the record in the instant cases. Thus, I conclude that reasonable diligence did not require the respondents to obtain them.

## Conclusion of Law

1. The Commission has jurisdiction over the cases, the respondents having admitted jurisdiction in their answers to the complaints. (Tr. 1: 9.)

2. The evidence fails to establish that the respondents violated any of the occupational health standards in issue in these cases.

## ORDER

The three citations in issue in these cases are vacated in their entirety.

ORDER

Before ROWLAND, Chairman; CLEARY, Commissioner.*/

BY THE COMMISSION:

The Secretary of Labor alleges that Baldwin Industries, Inc. ("Baldwin") committed nonserious violations of various provisions of the OSHA asbestos standard at 29 C.F.R. § 1910.1001.1/ The Secretary contends that NYTAL 200, an industrial talc produced by the Intervenor, R. T. Vanderbilt Company ("Vanderbilt"), and used by Baldwin, contains asbestos fibers, and that Baldwin was therefore required to affix caution labels to containers of NYTAL 200, monitor its workplace for asbestos fibers, and provide medical examinations for employees exposed to airborne asbestos fibers. Administrative Law Judge George O. Taylor, Jr. found that NYTAL

---

*/ Commissioner Cottine took no part in the consideration or decision of this case.

1/ This case was previously consolidated with Hull Pottery Co., OSHRC Docket No. 78-555. The cases are hereby severed for decisional purposes. Commission Rule 10, 29 C.F.R. § 2200.10.

200 does contain asbestos fibers, but he vacated the citation because he concluded that Baldwin did not and could not, with reasonable diligence, know of the presence of asbestos fibers in the talc.

Both participating members conclude that the judge's finding that NYTAL 200 contains asbestos fibers is supported by the preponderance of the evidence. They are divided, however, on whether the judge correctly found that Baldwin did not and could not, with reasonable diligence, have known of the presence of asbestos fibers in the talc. Chairman Rowland would adopt the judge's reasoning on this question and he notes that, in the absence of either actual or constructive knowledge of this fact on Baldwin's part, the citation is properly vacated. Prestressed Systems, Inc., 81 OSAHRC 43/D5, 9 BNA OSHC 1864, 1981 CCH OSHD ¶ 25,358 (No. 16147, 1981); General Electric Co., 81 OSAHRC 42/A2, 9 BNA OSHC 1722, 1981 CCH OSHD ¶ 25,345 (No. 13732, 1981).

Commissioner Cleary agrees that an employer's actual or constructive knowledge must be shown in order to sustain the finding of a violation. He would find, however, that Baldwin had the requisite knowledge in this case. Prior to the time of the alleged violation, Baldwin received a letter from Vanderbilt stating that OSHA had rescinded the authorization it had previously granted Vanderbilt to certify that Vanderbilt talcs do not contain asbestos. This letter put Baldwin on notice that the Secretary of Labor now considered Vanderbilt talcs to contain asbestos. In view of this knowledge of the Secretary's position and the well-known, serious health effects associated with asbestos exposure, a reasonably diligent employer would have conducted its own tests to determine whether its employees were being exposed to asbestos fibers. See Hermitage Concrete Pipe Co., OSHRC Docket No. 4678 (March 23, 1982).

Thus, in Commissioner Cleary's view, had Baldwin exercised reasonable diligence it could have known that NYTAL 200 contains asbestos fibers.

Commissioner Cleary would further conclude that Baldwin committed nonserious violations of 29 C.F.R. §§ 1910.1001(f)(1), 1910.1001(g)(2)(i), and 1910.1001(j)(2). Because its employees were exposed to measurable concentrations of airborne asbestos fibers, Commissioner Cleary concludes that Baldwin violated the monitoring and medical examination provisions of sections 1910.1001(f)(1) and 1910.1001(j)(2) under the interpretation of those standards set forth by the Commission in Research-Cottrell, Inc., 81 OSAHRC 26/B13, 9 BNA OSHC 1489, 1981 CCH OSHD ¶ 25,284 (No. 11756, 1981). He would further find that Baldwin violated section 1910.1001(g)(2)(i) by not affixing caution labels to bags containing NYTAL 200.

In order to resolve the impasse created by their differing views on the appropriate disposition of the case, the two participating members agree to vacate the direction for review. See Texaco, Inc., 80 OSAHRC 74/B1, 8 BNA OSHC 1758, 1980 CCH OSHD ¶ 24,634 (No. 77-3040, 1980). This disposition results in the judge's decision becoming the final order of the Commission.[2/] 29 U.S.C. § 661(i).

Accordingly, the direction for review is vacated. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRTARY

DATED: MAR 31 1982

---

2/ Because Baldwin is not aggrieved by this disposition, we deny its motion to reopen the record without deciding whether reopening of the record would otherwise be appropriate under the circumstances of this case.

DECISION AND ORDER

Taylor, Judge:

Background

The above-captioned cases were consolidated by an order of former Chief Judge David H. Harris, dated May 30, 1978. Hearings were conducted at Columbus, Ohio on June 19-22, 1978, and at Washington, D.C. on September 11-13, 1978.

The Complainant's Case Against Miller

Following an inspection of Miller's ceramic manufacturing business in Weedsport, New York, on September 28, 1977, Miller was issued a citation

for a nonserious violation of 29 C.F.R. § 1910.1001(j)(3).[1/] The citation alleges that Miller did not provide, or make available, comprehensive annual medical examinations to employees who were exposed to airborne levels of asbestos on the

> [m]ain floor, wet clay packing area, slip mixing tanks loading platform and elsewhere throughout the plant where talc is unloaded out of bags, handled or is airborne.

During the inspection, Peter Brown, an industrial hygienist employed by the Occupational Safety and Health Administration (OSHA), observed two of Miller's employees mixing and packing wet clay in Miller's "wet clay area." (Tr. 2: 153, 163-164.) The employees, Ron Moradorf and George Baker, were using talc from 50-pound bags of Nytal 100HR bearing the name of R. T. Vanderbilt Company as the manufacturer. (Tr. 1: 39; 2: 164, 190-191. Item 43, Respondent's Third Request for Admissions.) Brown observed dust as the bags were poured into the mixing tank. (Tr. 2: 164.) Thereafter, Brown obtained six air filter samples from the breathing zones of each of the two employees over a period of 7-1/2 hours. (Tr. 2: 165, 173, 175.) Brown also obtained a bulk sample from one of the bags of Vanderbilt talc. (Tr. 2: 178.) Both Moradorf and Baker told Brown that they had not received any medical examinations while working for Miller. (Tr. 2: 189-190.) Moradorf

---

1/ This health standard provides that:

> On or before January 31, 1973, and at least annually thereafter, every employer shall provide, or make available, comprehensive medical examinations to each of his employees engaged in occupations exposed to airborne concentrations of asbestos fibers. Such annual examination shall include, as a minimum, a chest roentgenogram . . . , a history to elicit symptomatology of respiratory disease, and pulmonary function tests to include forced vital capacity . . . and forced expiratory volume at 1 second. . . .

told Brown that he had been working for Miller for 2-1/2 years, and Baker told him that he had been employed by Miller for three months. (Tr. 2: 190-191.)

Brown forwarded all of the samples to OSHA's Salt Lake City laboratory for analysis. (Tr. 2: 180.) The laboratory assigned the following identifying numbers: bulk sample, A-6393; Baker air filter samples, A-6395 through A-6400; Moradorf air filter samples, A-6402 through A-6407. (Tr. 2: 182; Exh. C-9.)

Using phase contrast microscopy, dispersion staining, and related petrographic techniques to analyze a portion of bulk sample A-6393, Willard Dixon, an industrial hygienist employed by OSHA's Salt Lake City laboratory, concluded that two anthophyllite fibers,[2/] four tremolite fibers, and 10 fibers of either tremolite or anthophyllite were present. (Tr. 4: 644, 674, 696-699; Exh. C-21.) The remainder of the sample was sent for further analysis to Ian Stewart, the manager of the electron optics group of Walter C. McCrone Associates, Incorporated. (Tr. 2: 317, 4: 699-700; Exh. C-22.) Using transmission electron microscopy and related techniques, Stewart ascertained that more than two fibers of anthophyllite were present in the portion of the sample that he analyzed. (Tr. 5: 52-53, 121-122.)

Daryl Peterson, a physical science technician at OSHA's Salt Lake City laboratory, analyzed the 12 air filter samples obtained by Brown. (Tr. 4: 734, 7: 737; Exh. C-10.) Using dispersion staining on a slide prepared from sample A-6395, Peterson found six fibers of the tremolite-actinolite series. (Tr. 4: 739, 746; Exh. C-23.) At the request of Dixon, Peterson did another analysis

---

2/ As used in this decision, the term "fiber" means a particle that is longer than five micrometers (29 C.F.R. § 1910.1001(a)(2)), and that has an aspect ratio of at least three to one, that is, a particle whose length is at least three times greater than its width. (Para. 1.3, Exh. R-8.) See Borg-Warner Corp., 78 OSAHRC 18/A2 (No. 10757, 1978).

on A-6395, either with the same or a different slide, and detected at least 10 asbestos fibers. (Tr. 4: 747, 750; Exh. C-23.) On examining a portion of A-6396 using dispersion staining, Peterson observed 11 tremolite-actinolite fibers and one anthophyllite fiber. (Tr. 4: 748; Exh. C-23.) Using the same procedure on a part of A-6397, he ascertained that 11 tremolite-actinolite and six anthophyllite fibers were present. (Tr. 4: 749; Exh. C-23.) With dispersion staining, he found seven tremolite fibers and three anthophyllite fibers in the portion of A-6405 that was analyzed. (Tr. 4: 753; Exh. C-23.) He did "just routine phase contrast counting for total number of fibers present" on specimens from the remaining samples. (Tr. 4: 750; Exh. C-23.)

Stewart performed transmission electron microscopy on samples A-6404 and A-6405. (Tr. 5: 118.) His analysis of A-6404 reflected no asbestos fibers greater than five micrometers long. (Tr. 5: 118.) On analyzing A-6405, Stewart identified 20 to 30 anthophyllite fibers. (Tr. 5: 121.)

The Complainant's Case Against Hull

Hull, a manufacturer of pottery tableware, was inspected by Donald Cagle, an industrial hygienist employed by OSHA, during the period September 20-21, 1977. (Tr. 2: 209, 211.) As a result of the inspection, Hull was issued a citation for three nonserious violations. Item 1 of the citation alleges that Hull violated 29 C.F.R. § 1910.1001(c)(2)(i)[3/] in that spilled Ceramitalc HDT was dry swept in Hull's raw material storage area. Item 2

---

3/ Section 1910.1001(c)(2)(i) provides that:

> Insofar as practicable, asbestos shall be handled, mixed, applied, removed, cut, scored, or otherwise worked in a wet state sufficient to prevent the emission of airborne fibers in excess of the exposure limits prescribed in paragraph (b) of this section, unless the usefulness of the product would be diminished thereby.

See footnote 4, infra, for the pertinent contents of § 1910.1001(b).

avers that Hull violated 29 C.F.R. § 1910.1001(g)(2)(i)[4/] by not having caution labels affixed "[o]n the pallets and/or bags of Ceramitalc HDT prior to dumping in the clay mixer." Item 3 alleges that Hull failed to comply with 29 C.F.R. § 1910.1001(h)(2)[5/] in that empty Ceramitalc HDT bags were not disposed of in impermeable containers.

---

4/ Section 1910.1001(g)(2)(i) provides that:

> Caution labels shall be affixed to all raw materials, mixtures, scrap, waste, debris, and other products containing asbestos fibers, or to their containers, except that no label is required where asbestos fibers have been modified by a bonding agent, coating, binder, or other material so that during any reasonably foreseeable use handling, storage, disposal, processing, or transportation, no airborne concentrations of asbestos fibers in excess of the exposure limits prescribed in paragraph (b) of this section will be released.

Paragraph (b) of § 1910.1001 contains the following pertinent requirements:

> (2) Standard effective July 1, 1976. The 8-hour time-weighted average airborne concentrations of asbestos fibers to which any employee may be exposed shall not exceed two fibers, longer than 5 micrometers, per cubic centimeter of air. . . .
>
> (3) Ceiling concentration. No employee shall be exposed at any time to airborne concentrations of asbestos fibers in excess of 10 fibers, longer than 5 micrometers, per cubic centimeter of air. . . .

5/ Section 1910.1001(h)(2) provides that:

> Asbestos waste, scrap, debris, bags, containers, equipment, and asbestos-contaminated clothing, consigned for disposal, which may produce in any reasonably foreseeable use, handling, storage, processing, disposal, or transportation airborne concentrations of asbestos fibers in excess of the exposure limits prescribed in paragraph (b) of this section shall be collected and disposed of in sealed impermeable bags, or other closed, impermeable containers.

See footnote 4, supra, for the pertinent contents of § 1910.1001(b).

During his inspection, Cagle observed the activities of one of Hull's clay mixers and his helper. (Tr. 2: 216.) He saw the clay mixer cutting 50-pound bags of Ceramitalc HDT, dumping them into a mixing machine hopper, and operating the controls that fed water into the mixing machine. (Tr. 2: 216-217.) He also saw the clay mixer using a forklift in moving pallets of the material to the mixing machine. (Tr. 2: 217.) Cagle testified that from what he recalled the bags indicated that the talc was manufactured by the American Talc Company. (Tr. 2: 234.) Apparently, Cagle was mistaken and the talc was manufactured by the International Talc Company, a subsidiary of the R. T. Vanderbilt Company.[6/] (Tr. 2: 265-268.) Cagle observed the helper cutting clay that extruded from the mixing machine and stacking the extruded clay on a cart. (Tr. 2: 217-218.)

Neither the bags of Ceramitalc HDT nor the pallets on which they were stored had any caution labels on them. (Tr. 2: 234.) When the bags of Ceramitalc HDT were emptied, they were not disposed of in impermeable containers, rather the clay mixer simply threw them behind him and they were later placed in an open trash receptacle. (Tr. 2: 234-235.) Cagle observed broom marks where dry material was on the floor in the area where the Ceramitalc HDT was stored. Hull's management officer told Cagle that a broom was used for sweeping and that they "couldn't wet the material . . . because it would be slippery." (Tr. 2: 233.)

Cagle obtained three air filter samples from the breathing zone of the clay mixer and two from the breathing zone of his helper. (Tr. 2: 222-223.) Cagle also took six bulk samples. (Tr. 2: 226.) Cagle forwarded all of the samples to OSHA's Salt Lake City laboratory where they were assigned laboratory numbers and analyzed. (Tr. 2: 227, 229, 232.) The samples from

---

6/ Ceramitalc HDT is a trade name that is registered by the R. T. Vanderbilt Company. (Tr. 2: 267.)

the clay mixer were assigned laboratory numbers A-6236, A-6238, and A-6244. (Exh. C-11.) The ones from the helper were given laboratory numbers A-6237, and A-6245. (Exh. C-11.) Cagle took one of the bulk samples, laboratory number A-6239, from a bag of Ceramitalc HDT that had just been opened by the clay mixer. (Tr. 2: 226, 230; Exh. C-11.) He took four of the bulk samples, laboratory numbers A-6240 through A-6243, from dust that had settled on the floor. (Tr. 2: 227, 231; Exh. C-11.) A-6240 was taken at the base of some steps, about 15 feet from the helper's location at the mixing machine. A-6241 was taken near a post, about 15 feet from the clay mixer. (Tr. 2: 253, 3: 619: Exh. C-11.) A-6242 was obtained in the immediate vicinity of where the clay mixer worked at the machine. (Tr. 2: 254, 3: 619; Exh. C-11.) A-6243 was obtained at the location where the Ceramitalc HDT was stored, about 30 feet from where the clay mixer poured the bags into the machine. (Tr. 2: 251, 3: 619; Exh. C-11.) On Hull's request at the end of the inspection, Cagle took the sixth bulk sample from a torn bag of Westex Black Talc. (Tr. 2: 226, 253.) That talc, which was not being used, was located in another part of Hull's plant. (Tr. 2: 253.) The laboratory number of that sample is A-6246. (Tr. 2: 230-231; Exh. C-11.)

Dan Crane, a physical science technician at OSHA's Salt Lake City laboratory, analyzed the samples obtained by Cagle. (Tr. 2: 333, 3: 535.) Using phase contrast microscopy and related techniques, Crane found a number of fibers in filter samples A-6236, A-6237, A-6238, A-6244, and A-6245. (Tr. 3: 559-562; Exh. C-18.) However, except for sample A-6238, he did not analyze these samples by dispersion staining to ascertain the mineralogical content of these fibers. (Tr. 3: 587, 597, 613-614; Exh. C-18.) Crane's analyses by dispersion staining of three slides prepared from A-6238 revealed the presence of six tremolite or anthophyllite fibers. (Tr. 3: 597; Exh. C-18.) Using dispersion staining on eight slides prepared from bulk

sample A-6239 and four slides prepared from each of the bulk samples identified as A-6241, A-6242, and A-6243, he ascertained that the A-6239 specimens contained 79 fibers that were tremolite or anthophyllite, the A-6241 specimens contained 10 tremolite and two anthophyllite fibers, the A-6242 specimens contained seven fibers that were tremolite or anthophyllite, and the A-6243 specimens contained 34 asbestos fibers. (Tr. 3: 537-548, 551-554, 558; Exh. C-18.) Crane's analysis of bulk sample A-6240 indicated that no fibers were present. (Tr. 3: 550.) Similarly, he detected no asbestos in his analysis of the Westex bulk sample, A-6246. (Tr. 3: 559.)

Subsequently, Ian Stewart performed dispersion staining on bulk samples A-6239, A-6242, and A-6243 and found about 2 to 3 percent fibrous tremolite-actinolite present in A-6239 and A-6243 and "probably less than about 1/4 per cent in A-6242." (Tr. 5: 47, 49.) He also analyzed these samples using transmission electron microscopy. As a result, he identified four anthophyllite fibers in A-6239. (Tr. 5: 105.) Although he saw fibers in A-6242, he could not positively identify them as asbestos. (Tr. 5: 106-107, 109.) By electron microscopic examination of A-6243, Stewart found that A-6243 was substantially similar to A-6239 in that anthophyllite fibers were present in A-6243. (Tr. 5: 107-109.)

## The Complainant's Case Against Baldwin

Baldwin, a paint manufacturer, was inspected by David Barnhill, an OSHA industrial hygienist, during the period June 28-30, 1977, and by Sally Barber, another OSHA industrial hygienist, on October 6 and 11, 1977. (Tr. 3: 620-621; 2: 269, 272.) Following these inspections, Baldwin was issued, on January 17, 1978, a citation for four nonserious violations, which is

designated as Citation Number 2.[7/] Item 1 of the citation alleges that Baldwin's paint mixing area had not been monitored to determine whether the paint mixers were exposed to excessive levels of asbestos fibers as required by 29 C.F.R. § 1910.1001(f)(1).[8/] Item 2 avers that Baldwin violated 29 C.F.R. § 1910.1001(g)(2)(i)[9/] in that raw materials being used in the paint mixing area did not contain caution labels. Items 3 and 4 allege that Baldwin violated 29 C.F.R. § 1910.1001(j)(2)[10/] and (3),[11/] respectively, by not providing employees working in the paint mixing area with preplacement and annual medical examinations as required by these two standards.

---

7/ The file in the Baldwin case also contains a citation for a nonserious violation of 29 C.F.R. § 1910.132(a). That citation, designated as Citation Number 1 and issued on October 31, 1977, was not contested by Baldwin and has become a final order of the Commission by operation of law. (Tr. 1: 7.) See 29 U.S.C. § 659(a).

8/ This health standard provides, in pertinent part, that:

> Within 6 months of the publication of this section, every employer shall cause every place of employment where asbestos fibers are released to be monitored in such a way as to determine whether every employee's exposure to asbestos fibers is below the limits prescribed in paragraph (b) of this section.

9/ See footnote 4, supra, for the text of this standard.

10/ Section 1910.1001(j)(2) provides the following as to preplacement medical examinations:

> The employer shall provide or make available to each of his employees, within 30 calendar days following his first employment in an occupation exposed to airborne concentrations of asbestos fibers, a comprehensive medical examination, which shall include, as a minimum, a chest roentgenogram . . . , a history to elicit symptomatology of respiratory disease, and pulmonary function tests to include forced vital capacity . . . and forced expiratory volume at 1 second. . . .

11/ See footnote 1, supra, for text of 29 C.F.R. § 1910.1001(j)(3), the annual medical examination standard.

During his inspection, Barnhill met Baldwin's president, Mr. Carneal. (Tr. 3: 455, 622.) Carneal told Barnhill that the R. T. Vanderbilt talcs used by Baldwin did not contain asbestos and showed Barnhill some letters from Vanderbilt indicating that the talcs did not contain asbestos. (Tr. 3: 628.) Carneal also told Barnhill that Baldwin's employees had not been given any type of physical examination and that Baldwin had done no monitoring "for lead or silica or talc, or any compound." (Tr. 3: 628-630.) Barnhill obtained a bulk sample from a 50-pound bag of Nytal 200 that was being used in Baldwin's plant. (Tr. 3: 626, 629, 634.) Barnhill saw no asbestos caution labels on the bags of Nytal 200 that he observed. (Tr. 3: 629.) He also testified that he had no knowledge as to how long Baldwin had been using Nytal 200. (Tr. 3: 632.)

The bulk sample of Nytal 200 was sent to OSHA's Salt Lake City laboratory, where it was assigned laboratory number A-4976 and analyzed by Willard Dixon. (Tr. 3: 631, 4: 668; Exh. C-15.) Initially, in August 1977, Dixon analyzed A-4976 by using dispersion staining and related techniques. (Tr. 4: 668.) By scanning slides prepared from A-4976, he concluded "that asbestos fibers were present in low concentration around one percent or less." (Tr. 4: 669, 678; Exh. C-15.) In May 1978, he performed another analysis on A-4976 using the same petrographic techniques, but taking an actual fiber count on that occasion. (Tr. 4: 679, 681; Exh. C-20.) This analysis indicated the presence of five anthophyllite fibers, 17 tremolite fibers, and 19 fibers that were either anthophyllite or tremolite fibers. (Tr. 4: 688-691.)

Ian Stewart subsequently analyzed A-4976 using dispersion staining and found 3 to 5 per cent by weight of fibrous tremolite-actinolite. (Tr. 5: 47-49.) His electron microscopic examination of that sample indicated the presence of anthophyllite fibers. (Tr. 5: 116.)

During her inspection, Barber observed two of the respondent's paint mixers pouring talc and other dry materials into a paint mixing vat. (Tr. 2:

280-281.) The talc was in 50-pound bags of Nytal 200 manufactured by R. T. Vanderbilt. (Tr. 2: 281, 3: 453-454.) The bags had no caution labels on them to indicate that they contained asbestos material. (Tr. 2: 300.) Carneal told Barber that Baldwin had not performed any initial monitoring for the presence of asbestos and that Baldwin's employees had not been given any physical examinations. (Tr. 2: 300-301.) Barber did not know how long Baldwin had been in business or how long Baldwin had been using Nytal 200. (Tr. 2: 314, 3: 454-455.) One of the paint mixers told Barber that he had worked for Baldwin for one year. The other employee told her that he had worked for Baldwin for three months. (Tr. 3: 457.) Barber obtained five air filter samples from the breathing zones of each of the paint mixers. (Tr. 2: 280, 282, 287.) These samples were sent to OSHA's Salt Lake City laboratory where they were assigned laboratory numbers A-7015 through A-7024. (Tr. 2: 290-292, Exh. C-13.)

The samples were analyzed by Dan Crane. (Tr. 3: 465; Exh. C-14.) Using phase contrast microscopy and related techniques, he found a number of fibers in his analysis of all the samples except A-7021, which was unacceptable for analysis. (Tr. 3: 465, 512-515, 591; Exhs. C-14, C-17.) In addition, he performed dispersion staining on a part of A-7016 and ascertained that 10 asbestos fibers, either tremolite or anthophyllite, were present. (Tr. 3: 518, 529-531; Exh. C.-17.) Subsequently, by electron microscopic analysis of a portion of A-7016, Stewart identified two anthophyllite fibers and a large bundle of fibers that were comprised of anthophyllite fibers and what he believed to be chrysotile fibers. (Tr. 5: 110-112, 115-116.)

## The Case for the Respondents

Dr. Ann Wylie testified for the respondents as an expert witness on mineralogy and light microscopy. (Tr. 6: 51.) Randall Ross testified for the respondents as an expert witness on electron microscopy, electron

diffraction, and energy dispersion analysis. (Tr. 6: 148-149, 7: 4.) The gist of their testimony is that the analytical techniques used by the Salt Lake City laboratory technicians and by Ian Stewart were inadequate to establish the presence of asbestos fibers.

Wylie testified that the Salt Lake City laboratory personnel did not perform all of the steps she would have used in analyzing the samples. (Tr. 6: 131.) She would have used the ten step procedure described in Exhibit R-30 if she received a sample for analysis that she did not know anything about. (Tr. 6: 52-54, 59.) When asked if she would follow all of these steps if she were asked to analyze a sample for the six asbestos minerals enumerated in 29 C.F.R. § 1910.1001(a)(1), that is, chrysotile, amosite, crocidolite, tremolite, anthophyllite, and actinolite, she answered as follows:

> Yes, I would, unless I knew, for example, exactly the locality it came from and what minerals were there to start with, or if I had some previous knowledge about the sample that I could eliminate a large group of minerals for some reason.
>
> Then perhaps maybe it wouldn't be necessary to go through them all. But without a lot of knowledge, previous knowledge, I wouldn't, I couldn't identify without going through those steps, no. (Tr. 6: 62-63.)

In her opinion, the Salt Lake City analyses were inadequate to identify the minerals in the samples unless there was prior knowledge of the mineral content of the samples. She would have run an x-ray diffraction on the bulk samples. (Tr. 6: 64.)

Wylie stated it was difficult to distinguish tremolite, tourmaline, and prehnite by dispersion staining and that richterite cannot be distinguished from tremolite optically. (Tr. 6: 68-69.) However, tremolite can be distinguished from pectolite and wollastonite by dispersion staining if care is used. (Tr. 6: 70-71.)

Relying on various publications, Wylie testified that tremolite, anthophyllite, and actinolite exist in both asbestiform and nonasbestiform. (Tr. 6: 79-87; Exhs. R-25, R-33.) She explained that from a mineralogical viewpoint a true asbestos fiber is one that grows as a fiber in nature, whereas a cleavage fragment is a fragment that is broken from a larger particle. (Tr. 6: 89, 127.) Using Exhibit R-32, she pointed out illustrations of fibers and cleavage fragments. (Tr. 6: 90-94.) Although she had not heard that a cleavage fragment presents a health hazard, such a fragment would be classified as an asbestos fiber under the OSHA definition if it contained one of the six minerals enumerated in 29 C.F.R. § 1910.1001(a)(1), was longer than five micrometers, and had an aspect ratio of at least three to one.[12/] (Tr. 6: 93-94, 102.) However, it should not be classified as an asbestiform mineral because it didn't "grow as asbestos." (Tr. 6: 127.) In Wylie's opinion, "[a] particle three times longer than it is wide is not a fiber" from a mineralogical standpoint. (Tr. 6: 94-95.) Her study of asbestos, under a grant from the Bureau of Mines, shows that

> for particles longer than five micrometers, about 99 percent of all asbestos fibers have an aspect ratio of about ten to one, and more than half have an aspect ratio in excess of 50 to one. (Tr. 6: 96.)

In analyzing a massive variety of tremolite that was crushed, she found that only five percent of the particles had aspect ratios in excess of ten to one and none were in excess of 50 to 1. (Tr. 6: 96-97.)

Ross testified as to the importance of having appropriate internal standards in analyzing material by electron microscopic techniques. (Tr. 7: 4-6, 17-18.) He also testifed as to the need to have a tilting capacity on the microscope used in such an analysis. (Tr. 7: 6-17, 19-22.)

---

12/ See footnote 2, supra.

Ross reviewed Exhibits C-31A-F (Tr. 7: 26), consisting of six photographs of the anthophyllite standards that were used by Stewart in performing his analyses. (Tr. 5: 57.) Ross also reviewed Exhibits C-26, C-27, and C-28, which are illustrations of the techniques used by Stewart in analyzing various samples. (Tr. 5: 81, 83-84, 94, 95; 7: 35-45.) Having made a visual observation of Exhibits C-31A-F and having made various measurements on them, Ross concluded that Stewart had used a poor anthophyllite standard. (Tr. 7: 26-32.) However, Ross also indicated that his opinion might be influenced by deviations resulting from the photographic process and that he would like to see the negatives. (Tr. 7: 32-33.)

Ross stated that Stewart's failure to count the angstrom spacings between the layer lines on the diffraction patterns was generally unacceptable. (Tr. 7: 36.) In Ross's opinion, Exhibit C-27P (fiber bundle, Baldwin, A-7016) and the diffraction patterns shown in the following exhibits were of little or no value for identifying asbestos fibers: C-26Q (Miller, A-6405); C-27N (fiber 1, Baldwin, A-7016); C-27O (fiber 2, Baldwin, A-7016); C-27Q (fiber bundle, Baldwin, A-7016); C-28E (fiber 2, Hull, A-6239); C-28G (fiber 3, Hull, A-6239); C-28K (fiber 4, Hull, A-6239). (Tr. 7: 35-45.) Ross qualified his opinions as to these exhibits by the reservation "that there is a question in the translation . . . from the negative to the print" because deviations might have been introduced by normal photographic procedures. (Tr. 7: 63.) Accordingly, Ross "put in a very strong request to see the original data." (Tr. 7: 65.)

Ross also criticized Stewart's analyses where no photographs were taken because Stewart "merely eyeballed the diffraction pattern and concluded that he had found an amphibole." (Tr. 7: 45.) Ross further pointed out that in an energy dispersive analysis there is a better chance of getting a pure chemical sample, uncontaminated by surrounding

interference particles, by using a selected point method rather than the "elongated concept" used by Stewart. (Tr. 7: 48.)

Findings of Facts in the Miller Case

1. On September 28, 1977, at Miller's plant located in Weedsport, New York, two of Miller's employees, Ron Moradorf and George Baker, were exposed to airborne concentrations of at least two asbestos fibers.

2. Moradorf and Baker had worked for Miller for 2-1/2 years and three months, respectively, and no medical examinations had been provided, or made available, to them.

3. The evidence fails to establish how long Miller had been using Nytal 100HR.

4. The evidence fails to establish that Miller possessed actual or constructive knowledge that Nytal 100HR contained asbestos.

Findings of Fact in the Hull Case

1. On or about September 21, 1977, at Hull's plant located in Crooksville, Ohio, spilled Ceramitalc HDT was dry swept in the vicinity of the raw material storage area, asbestos caution labels were not affixed to the bags of Ceramitalc HDT or the pallets on which they were stored, and empty Ceramitalc HDT bags were not collected or disposed of in sealed, impermeable bags or other closed, impermeable containers.

2. The evidence fails to establish that it was reasonably foreseeable that the failure to collect and dispose of the empty Ceramitalc HDT bags in impermeable bags or impermeable containers could have resulted in the exposure of Hull's employees to airborne concentrations of asbestos fibers in excess of those specified in 29 C.F.R. § 1910.1001(b)(2) or (3).[13/] Similarly, there is no evidence that the dry sweeping of spilled Ceramitalc HDT would

---

13/ See footnote 4, supra, for the text of 29 C.F.R. § 1910.1001(b)(2) and (3).

exceed the limits provided in § 1910.1001(b)(2) or (3). However, the evidence establishes that some of the Ceramitalc HDT being used by Hull's employees contained at least two asbestos fibers.

3. The evidence fails to establish that Hull possessed actual or constructive knowledge that Ceramitalc HDT contained asbestos.

Findings of Facts in the Baldwin Case

1. From about June 30, 1977, to October 11, 1977, at Baldwin's plant in Foley, Alabama, Nytal 200 was used by Baldwin's employees while mixing paint. However, the evidence fails to establish that Nytal 200 was used by Baldwin for any additional period of time.

2. Baldwin had not performed any initial monitoring for the presence of asbestos and had not provided, or made available, medical examinations for its employees.

3. Asbestos caution labels were not affixed to the bags of Nytal 200 used by Baldwin's employees.

4. The evidence fails to establish that any employee who worked with Nytal 200 had been employed by Baldwin for as long as one year. It does establish, however, that two such employees, paint mixers, had been employed by Baldwin for more than 30 days.

5. The evidence establishes that the two paint mixers were exposed to airborne concentrations of at least two asbestos fibers each and that these fibers were released by the Nytal 200 that they were using.

6. The evidence fails to establish that Baldwin possessed actual or constructive knowledge that Nytal 200 contained asbestos.

Discussion

Prior to trial, the respondents filed a motion to dismiss all citations because the asbestos standards were improperly promulgated and unenforceably vague. The motion also asserts "that Complainant's continued

enforcement of an unconstitutional and unenforceably vague standard is arbitrary, capricious and constitutes an abuse of direction." The respondent's motion was considered and denied at trial. (Tr. I: 28-37, 42-52.) In a joint post-trial brief, the respondents and the intervenor ask that I reconsider my denial of the motion. I adhere to my ruling for the reasons stated at trial. In addition, see the discussion of the dichotomy pertaining to the "asbestiform" and so-called "nonasbestiform" of minerals, infra. Also see National Industrial Constructors, Inc. v. OSHRC, 583 F.2d 1048, 1052-53 (8th Cir. 1978.)

Since I found at trial that the asbestos standards were not improperly promulgated or unenforceably vague, it was unnecessary for me to address the assertion that the complainant's enforcement of the standards was arbitrary, capricious, and an abuse of discretion. The joint post-trial brief asserts, however, that "the asbestos standard . . . is arbitrary and capricious." This assertion relates to the wisdom of the asbestos standards. The Commission has held that it is not its function to address the wisdom of the standard. Borg-Warner Corporation, 78 OSAHRC 18/A2 n. 11 (No. 10757, 1978.) Nevertheless, to alleviate possible appellate problems that could result from the absence of a ruling, I conclude that the evidence does not show that the asbestos standards are arbitrary and capricious.

Annual medical examinations are required under 29 C.F.R. § 1910.1001(j)(3) when employees are exposed to airborne concentrations of asbestos, regardless of the levels of exposure. GAF Corp. 75 OSAHRC 3/A2 (No. 3203, 1975), aff'd, 561 F.2d 913 (D.C. Cir. 1977.) However, since §1910.1001(j)(3) applies to employees engaged in occupations exposed to airborne concentrations of asbestos "fibers," I conclude that the standard applies to situations where employees are exposed to airborne

concentrations of at least two asbestos fibers, or will be in the future. See Gilles & Cotting, Inc., 76 OSAHRC 30/D9 (No. 504, 1976.) In these respects, I interpret the requirements for preplacement medical examinations in 29 C.F.R. § 1910.1001(j)(2) to be the same as those in § 1910.1001(j)(3) because the significant language in both standards is identical.[14/]

The evidence establishes that two of Miller's employees, Moradorf and Baker, were exposed to airborne concentrations of at least two asbestos fibers. Dust was observed in the air when bags were poured into the mixing tank. Dixon's analysis of the bulk sample (A-6393) revealed the presence of two anthophyllite fibers, four tremolite fibers, and 10 fibers of either tremolite or anthophyllite. The presence of asbestos fibers in this sample was verified by Stewart whose analysis indicated that more than two

---

14/ In their joint post-trial brief, the respondents and the intervenor contend that the medical examination standards are unenforceably vague. In support of this contention they assert that evidence adduced at trial (Tr. 3: 415-425) shows an "unofficial exclusion level 'policy' in certain OSHA offices" providing "that concentrations of .1 asbestos fibers per cubic centimeter of air or greater must be found before any citation under the medical examination provisions would be issued." In this connection, I am asked to take official notice of OSHA Program Directive Number 300-16 issued on October 11, 1978, which, in effect, formally announces this policy. At best, the matters referred to in the joint post-trial brief merely show that the complainant has changed his interpretation of the standards for enforcement purposes. See GAF Corp. v. OSHRC, 561 F.2d.913 (D.C. Cir., 1977). They do not detract from the specificity of the standards as promulgated by the complainant and as interpreted by the Commission and the United States Court of Appeals for the District of Columbia Circuit. Furthermore, the implementation or pronouncement of policies by the Secretary of Labor or his representatives have no binding legal effect on either the Secretary or the Commission when they have not been promulgated as rules on regulations. See Bristol-Myers Co., 78 OSAHRC 106/D13 n.1 (No. 77-3854, 1978); Alfred S. Austin Construction Co., 76 OSAHRC 50/A2 (No. 4809, 1976); GAF Corp.,77 OSAHRC 207/E6 (No. 77-616, 1977) (Alfieri, J. ). Of course, Policy Directive Number 300-16, is also not binding here because it was not issued until well after the issuance of the citations in the instant cases.

anthophyllite fibers were present.[15/] Peterson's analysis of A-6405, an air filter sample taken on Moradorf, showed that seven tremolite and three anthophyllite fibers were present. The presence of asbestos fibers in this sample was also verified by Stewart who observed 20 to 30 anthophyllite fibers in a portion of the sample.

Irrespective of the exposure of Moradorf and Baker to asbestos fibers, the evidence is insufficient to establish that Miller violated 29 C.F.R. § 1910.1001(j)(3). Baker had worked for Miller for only three months. More important, there is no evidence as to how long Miller had been using Nytal 100HR. Thus, it cannot be said that Miller had failed to provide Moradorf or Baker with the annual medical examinations required by § 1910.1001(j)(3). Similarly, the failure to establish how long Miller had been using Nytal 100HR precludes amending the citation and finding a violation of 29 C.F.R. § 1910.1001(j)(2), for a failure to provide preplacement medical examinations.

The evidence establishes that Baldwin's paint mixers were exposed to airborne concentrations of at least two asbestos fibers. This is established by Crane's and Stewart's analyses of air filter sample A-7016. Additionally, Dixon's and Stewart's analyses of the bulk sample obtained by Barnhill (A-4976) show that asbestos fibers were present in that sample. However, as in the Miller case, a violation of 29 C.F.R. § 1910.1001(j)(3) has not been established as the evidence fails to show that either of the paint mixers had

---

15/ Stewart testified that analysis by transmission electron microscopy and related techniques was necessary to rule out the possibility of erroneously counting talc fibers as asbestos fibers, which could not be accomplished by the analysis techniques used by OSHA's Salt Lake City laboratory. (Tr. 5: 53.) Accordingly, athough I note that Peterson found asbestos fibers in A-6395, A-6396, and A-6397, I do not rely on those analyses in concluding that Moradorf and Baker were exposed to airborne concentrations of at least two asbestos fibers as Peterson's findings were not verified by Stewart. Also, I do not rely in this decision on other OSHA analyses that have not been verified by Stewart.

been working for Baldwin for a year[16/] or that they had been using Nytal 200 for a year in their work.

Barber's testimony establishes that both paint mixers had worked for Baldwin for more than 30 days. Her testimony coupled with that of Barnhill shows that Baldwin had been using Nytal 200 for slightly more than three months between June 1977 and October 1977,[17/] well over the 30 calendar days specified in the preplacement medical examination standard, 29 C.F.R. § 1910.1001(j)(2).

Asbestos caution labels must be affixed to products containing asbestos "fibers." 29 C.F.R. § 1910.1001(g)(2)(i). As with the medical examination standards, I conclude that caution labels are required when a product contains at least two asbestos fibers.[18/] As previously indicated,

---

16/ Barber testified that one of the employees told her that he had worked for Baldwin for three months. As she "recall[ed]" the other indicated to her that he had worked for Baldwin for one year. (Tr. 3: 457.) I consider this to be a rough approximation that could have fell short of being a full year. Accordingly, I find that Barber's testimony is not sufficiently definitive to establish that the employee had worked for Baldwin for a year.

17/ No violation can be found on the date of Barnhill's inspection because the citation was not issued to Baldwin within six months after Barnhill's inspection. 29 U.S.C. § 658(c). Nevertheless, Barnhill's testimony can be used in part to establish the existence of violations at the time of Barber's inspection. For example, Barnhill's testimony can be used to establish that Baldwin was using Nytal 200 at the time of Barnhill's inspection. Furthermore, the bulk sample obtained by Barnhill can be used to show that the Nytal 200 in use at the time of Barnhill's inspection contained asbestos fibers.

18/ To establish a violation of 29 C.F.R. § 1910.1001(g)(2)(i), the complainant is not required to prove "that during any reasonably foreseeable use, handling, storage, disposal, processing, or transportation, no airborne concentrations of asbestos fibers in excess of the exposure limits prescribed in [29 C.F.R. § 1910.1001(b)] will be released." That requirement pertains only to a situation "where asbestos fibers have been modified by a bonding agent, coating, binder, or other material," which is not the situation in the Baldwin and Hull cases.

the presence of at least two asbestos fibers in the Nytal 200 used by Baldwin is established by Crane's, Dixon's, and Stewart's analyses of A-7016 and A-4976. Barber's testimony shows that the bags of Nytal 200 that she observed at the respondent's plant did not have asbestos caution labels.

Cagle's testimony establishes that neither the bags of Ceramitalc HDT used by Hull nor the pallets on which they were stored had asbestos caution labels. The presence of at least two asbestos fibers in the Ceramitalc HDT used by Hull is established by Crane's and Stewart's analyses of bulk sample A-6239 taken from a bag of Ceramitalc HDT and of bulk sample A-6243 taken from the floor in the area where the Ceramitalc HDT was stored.[19/]

Under 29 C.F.R. § 1910.1001(c)(2)(i) asbestos must be handled or worked in a wet state sufficient to prevent the emission of airborne fibers in excess of the exposure limits specified in 29 C.F.R. § 1910.1001(b)(2) and (3). Obviously, this presupposes that when handled or worked in the dry state there would be an emission of airborne asbestos fibers in excess of the § 1910.1001(b)(2) and (3) limits. There is no evidence that the dry sweeping of spilled Ceramitalc HDT would exceed these limits in Hull's plant.

Hull's empty Ceramitalc HDT bags should have been collected and disposed of in impermeable containers if it was "reasonably foreseeable" that their future use or processing might produce airborne concentrations of asbestos fibers in excess of the limits prescribed in § 1910.1001(b)(2) and (3). There is no evidence to establish that it was reasonably foreseeable from Hull's use or other processing of these empty bags that these limits might be exceeded.

---

19/ Crane also found asbestos fibers in air filter sample A-6238 and in bulk samples A-6241 and A-6242. Stewart did not analyze A-6238 or A-6241 and could not identify asbestos in A-6242. Therefore, I do not rely on Crane's analyses of these samples. See footnote 15, supra.

The asbestos monitoring standard, 29 C.F.R. § 1910.1001(f)(1) requires monitoring, "[w]ithin 6 months of the publication of this section," of places of employment when asbestos "fibers" are released. Therefore, to establish a violation of this standard, it must be shown that at least two asbestos fibers were actually released from the Nytal 200 being used at Baldwin's plant. See Goodyear Tire & Rubber Company, 77 OSAHRC 82/A2 (No. 13442, 1977.) This is established by Crane's and Stewart's analyses of air filter sample A-7016. The fact that Baldwin had done no initial monitoring for asbestos is established by Carneal's admission to Barber that none had been done.

In my opinion, if an employer should have monitored for asbestos within six months of the publication of 29 C.F.R. § 1910.93(a),[20/] his duty to monitor continues as long as he continues to use products that release asbestos fibers. See Yelvington Welding Services, 78 OSAHRC 84/D6 (No. 15958, 1978). Also, I interpret the standard to require initial asbestos monitoring within a reasonable time after an employer knows or, by the exercise of reasonable diligence, could have known that a product used by him was causing the release of asbestos fibers in his place of employment, even though he was not using this product during the initial six-month period.[21/] As previously indicated, the evidence establishes that Baldwin had

---

20/ The asbestos standards were previously codified at 29 C.F.R. § 1910.93a and, on May 28, 1975 were recodified at 29 C.F.R. § 1910.1001. 40 Fed. Reg. 23072 (1975).

21/ The conclusions expressed in this paragraph are supported by 29 C.F.R. § 1910.1001(f)(3)(ii), which provides that:

> After the initial determinations required by paragraph (f)(1) of this section, samples shall be of such frequency and pattern as to represent with reasonable accuracy the levels of exposure of the employees. In no case shall sampling be at intervals greater than 6 months for employees whose exposures to asbestos may reasonably be foreseen to exceed the exposure limits prescribed in paragraph (b) of this section.

been using Nytal 200 from the time of the first inspection to the time of the second one, a period of slightly more than three months, but does not establish when Baldwin first started to use Nytal 200. If Baldwin knew at the time of the first inspection or, by the exercise of reasonable diligence, could have known at that time that Nytal 200 contained asbestos fibers, then the time interval between the two inspections would constitute more than a reasonable period for the accomplishment of the required monitoring.

In my opinion, there is no validity to the respondent's attempt, through the testimony of Wylie and Ross, to impeach the analyses of the samples by Stewart and OSHA's Salt Lake City laboratory. Wylie testified that the Salt Lake City analyses were inadequate unless there was prior knowledge of the mineral content of the samples. However, the Salt Lake City laboratory had such knowledge because the analysts could readily identify a Vanderbilt product under a microscope and had prior knowledge of the mineralogical content of Vanderbilt products. (Tr. 4: 713-714, 717-718, 722.) Also see Borg-Warner Corp., 78 OSAHRC 18/A2 (No. 10757, 1978); Wenczel Tile Company of Florida, Inc., OSAHRC Docket No. 77-2039 (August 14, 1978) (Brady, J.), Commission review ordered, September 13, 1978. Moreover, Stewart's verification of several of the Salt Lake City analyses negates Wylie's reservations as to the mineral content of those samples.[22/]

Ross' criticisms of Stewart's analyses were based on photographic exhibits that were introduced by the complainant merely to illustrate the techniques used by Stewart. Ross admitted that his criticisms could be invalid because of possible deviations in the photographs and requested an opportunity to see the original data. At the trial, I ruled that the respondents' experts would be afforded an opportunity to examine this data and that following the examination I would grant a motion to reopen the

---

22/ See footnote 15, supra.

hearing to present evidence as to what the examination revealed. (Tr. 6: 33-34; 7: 80.) The respondents' counsel agreed that he would subsequently advise me as to whether the respondents would avail themselves of the opportunity to have their experts examine the data. (Tr. 7: 77-80.) Thereafter, by a letter dated September 26, 1978, the opportunity was declined. Accordingly, I find that Ross's criticisms are entitled to no significant weight.

The conclusions of the complainant's analysts concerning the mineralogical composition of the fibers they analyzed are supported by Mineral Product Safety Data Sheets prepared by Vanderbilt on May 1, 1975, and January 15, 1978. (Exhs. C-32, C-33.) Those data sheets show that 50 to 70 percent of Ceramitalc HDT and Nytal 100HR and 40 to 60 percent of Nytal 200 is "tremolite and/or anthophyllite," albeit "non-asbestiform."

The Commission has held that the so-called "nonasbestiform" of the minerals regulated by the complainant's asbestos standards fall within the purview of the standards. Borg-Warner Corp., supra. I find nothing in the instant cases that detracts from that holding. Wylie's testimony represents a mineralogical viewpoint as contrasted with the health considerations inherent in the asbestos standards.[23/] Whether the inhalation of tremolite, anthophyllite, and actinolite cleavage fragments[24/] that are longer than five

---

23/ Thus, the term "nonasbestiform" appears to be a misnomer from a health standpoint.

24/ As a matter of practice, OSHA's Salt Lake City laboratory did not count a particle as a fiber if its width was greater than five micrometers. (Tr. 3: 506; 4: 717-718, 741.) This tended to eliminate the counting of a cleavage fragment as a fiber. (Tr. 4: 717.)

micrometers with an aspect ratio of at least three to one[25/] is injurious to an employee's health is unclear from the record in these cases. However, there was no evidence introduced during the trial that tends to show that it is not just as injurious to an employee's health to inhale these particles as it is to inhale particles that differ from them only in that they grow naturally as asbestos fibers.[26/] The resolution of this matter is not essential in these cases because a comparison of photographs of tremolite, anthophyllite, and actinolite cleavage fragments and asbestiform fibers (figures 3, 4, and 5, pages 7, 8, and 9, Exh. R-32) with the illustrative photographs of Stewart's analyses of samples A-6405 (Exh. C-26P), A-7016 (Exhs. C-27M and P), and A-6239 (Exhs. C-28A, C, D, F, H, and J) clearly establishes that the particles analyzed by Stewart were of the asbestiform variety as used in mineralogical parlance. (Tr. 6: 97-99.) More important, the respondents and the intervenor concede at page 26 of their joint post-trial brief that the

---

25/ Although the three to one aspect ratio requirement is not contained in the asbestos standards, it constitutes a subsequent interpretation of the standard by the complainant. See Borg-Warner Corp., supra. Since that interpretation increases the complainant's burden of proof, the respondents cannot be prejuduced by its use. In regard to Wylie's testimony that about all asbestos fibers have an aspect ratio greater than three to one, I note that Stewart testified that he found some asbestos fibers with about a 100 to 1 aspect ratio. (Tr. 5: 96, 194.)

26/ After trial, however, the respondents requested me to take official notice of pages 2 and 3 of DHEW Publication Number (NIH) 79-1681, entitled "Asbestos: An Information Resource," published in May 1978. That publication states that "recent biological studies suggest that, in terms of carcinogenic activity, mineral shape may be more important than chemical nature." However, several studies by the National Institute for Occupational Safety and Health are more relevant to the health hazards associated with the Vanderbilt products involved in the instant cases. These studies show an increased risk of lung cancer among former miners and millers who had worked with tremolitic talcs for the R. T. Vanderbilt Company in upper New York and reveal an elevated prevalence of pleural thickening is nearly one of every three Vanderbilt tremolitic talc workers with greater than 15 years of exposure. (Exh. R-9.)

complainant's photographs "apparently depict mineralogical fibers" and that "[t]he fibrous morphology of the suspect particles is not debated."[27/]

To establish any violation of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678, the complainant must prove that the respondent possessed actual or constructive knowledge of the alleged violative conditions. Wally Taylor Construction Co., 76 OSAHRC 142/F6 (No. 9413, 1976), and the cases cited therein; Scheel Construction, Inc., 76 OSAHRC 138/B6 (No. 8687, 1976). In the instant cases, that equates to a requirement that the complainant prove that the respondents knew or, by the exercise of reasonable diligence, could have known that they were using talcs that contained asbestos fibers. I conclude that the complainant failed to prove that any of the respondents possessed such knowledge.

The complainant attempted to prove that the respondents possessed the requiste knowledge through the testimony of Allen Harvey, the manager

---

27/ DHEW Publication Number (NIH) 79-1681 also indicates the following:

> The identification of asbestos is complex because many of the minerals that are chemically almost identical to different varieties of asbestos (e.g., grunerite to amosite, serpentine to chrysotile) exhibit perfect prismatic cleavage (the ability to break along well-defined crystallographic planes), so that physical degradation often leads to the formation of minute cleavage fragments that are chemically as well as physically indistinguishable from asbestos fibers. Recent comprehensive studies at the U. S. Bureau of Mines have concluded that there is currently no absolute way to distinguish between finely divided asbestos and certain other minerals of similar composition. (Emphasis added.)

Because of their indefiniteness, these conclusions are of little significance in the instant cases. Moreover, for the reasons previously discussed in the text, the evidence establishes the presence of asbestos fibers in various samples of Ceramitalc HDT, Nytal 100HR, and Nytal 200 that were analyzed.

for technical development for the R. T. Vanderbilt Company. (Tr. 7: 81.) Harvey identified an unsigned letter (Exh. C-34) bearing the letterhead of the R. T. Vanderbilt Co., dated January 25, 1977, addressed "To Our Talc Customers," which is entitled "Talc Certification." (Tr. 7: 87.) The body of the letter states the following:

> In a letter from the U. S. Department of Labor, dated October 9, 1974, we were authorized to certify that our talc products do not contain asbestos. This reasonable move was followed by OSHA Field Memorandum #74-92, which attempted to clarify the differences between asbestiform and non-asbestiform minerals.
>
> Dr. Morton Corn, the most recent Assistant Secretary of Labor and head of OSHA, informed us in a letter received January 24, 1977, that this authorization has now been rescinded and the Field Memorandum has been cancelled. These most recent rulings were made just prior to Dr. Corn's resignation and mean we are no longer in a position to certify that our talc products do not contain asbestos even though they are composed of the same non-asbestiform minerals processed the same as always.
>
> We are unable to explain this unwarranted reversal of policy by OSHA, but you can be assured we will actively oppose this injustice with all the technical and legal means available to us. Our talcs have been the subject of two OSHA cases during the past year which have gone to litigation. One case remains unresolved and in the other one the Government backed down from their asbestos contention and accepted a settlement which was not even under the Asbestos Standard.
>
> We thank you for your continued consideration and support.

Although Harvey participated in the preparation of the letter, he was not sure that it had been sent to Vanderbilt's talc customers. (Tr. 7: 88-89.) Even if there was evidence that the letter had been mailed to each of the respondents, I would not infer that it had been received by them. There is, however, some evidence from which it can be inferred that Baldwin received

the letter. Based on letters received from Vanderbilt, Carneal told Barnhill that the Vanderbilt talcs being used by Baldwin "don't have any asbestos in them." (Tr. 3: 628.) Subsequently, Carneal gave Barber a letter from Vanderbilt, dated January 25, 1977, addressed to its talc users, and entitled "Talc Certification." (Tr. 3: 455.)

Vanderbilt's letter of January 25, 1977, shows that Vanderbilt, under an authorization granted by the complainant, had certified to its talc users that Vanderbilt's talcs did not contain asbestos. Although the letter states that the complainant had withdrawn the previously granted certification authority, it continues to tell Vanderbilt talc users that Vanderbilt's talc products do not contain asbestos. In my opinion, it was reasonable for users of Vanderbilt talcs, including those who received the January 25, 1977, letter to rely on Vanderbilt's assertions that its talcs were free of asbestos.[28/] It is clear that Baldwin believed the assertions, and it is reasonably expectable that other users also believed them. It would most certainly be unreasonable to expect every user of Vanderbilt talcs throughout the nation to individually have these talcs analyzed for asbestos after having been told by the producers that the talcs did not contain asbestos.[29/] The difficulties of

---

28/ There is no other evidence which tends to show that the respondents had any cause to believe that Vanderbilt talcs contained asbestos. To the contrary, the Mineral Product Safety Data Sheets prepared by Vanderbilt on May 1, 1975, and January 15, 1978, to inform its customers of the ingredients in Vanderbilt talcs, indicate that no asbestos is contained in Ceramitalc HDT, Nytal 100HR, or Nytal 200, as the tremolite and anthophyllite contained in these talcs are characterized as "non-asbestiform." (Tr. 7: 82-86; Exhs. C-32, C-33.)

29/ In instances such as this, it would seem that enforcement should be initially directed against the producers to require them to affix asbestos labels to their products where appropriate. If users were so alerted to the presence of asbestos, it should obviate the necessity "to litigate numerous similar cases through the administrative and appeal procedure provided" under the Act. Continental Can Co., U.S.A. v. Marshall, 455 F.Supp. 1015 (S. D. Ill., 1978).

obtaining such analyses are well demonstrated by the record in the instant cases. Thus, I conclude that reasonable diligence did not require the respondents to obtain them.

## Conclusion of Law

1. The Commission has jurisdiction over the cases, the respondents having admitted jurisdiction in their answers to the complaints. (Tr. 1: 9.)

2. The evidence fails to establish that the respondents violated any of the occupational health standards in issue in these cases.

## ORDER

The three citations in issue in these cases are vacated in their entirety.

| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>BETHLEHEM STEEL CORPORATION,<br>Respondent. | OSHRC Docket No. 79-310 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

CLEARY, Commissioner:

This is a case under the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). A decision of Administrative Law Judge Ralph B. Maxwell is before the Commission for review under section 12(j) of the Act, 29 U.S.C. § 661(i). In his decision, Judge Maxwell granted Respondent's motion to dismiss and vacated citation 2, which alleges a serious violation of the Act due to noncompliance with the general industry personal protective equipment standard at 29 C.F.R. § 1910.132(a). 1/ His sole reason for vacating was his conclusion

1/ The standard provides:

> Subpart I - Personal Protective Equipment
> § 1910.132 General requirements.
> (a) Application. Protective equipment, including personal protective equipment for eyes, face, head, and extremities, protective clothing, respiratory devices, and protective shields and barriers, shall be provided, used, and maintained in a sanitary and reliable condition wherever it is necessary by reason of hazards of processes or environment, chemical hazards, radiological hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact.

that section 1910.132(a) was "inappropriate as the basis for the citation," i.e., it could not be applied, as the Secretary of Labor ("the Secretary") sought to apply it in this case, to compel the use of safety belts as protection against a falling hazard.

The Secretary filed a petition for discretionary review, and Commissioner Cottine directed review on the following issue raised in the Secretary's petition:

> Whether the judge erred in vacating a citation item alleging noncompliance with 29 C.F.R. § 1910.132(a) on the grounds that the cited standard does not require protective equipment where employees are exposed to falling hazards.

For the reasons stated below, Commissioner Cottine and I agree that safety belts are a form of protective equipment required under section 1910.132(a) and that falling hazards are encompassed by the language "hazards of processes or environment" within the meaning of that standard. Nevertheless, for the reasons set forth in our separate opinions, Chairman Rowland and I agree that Judge Maxwell did not err in granting Respondent's motion to dismiss. Accordingly, the judge's decision is affirmed.

I

As a result of an inspection of the mold yard in Respondent's Burns Harbor steel processing plant in Chesterton, Indiana, conducted by a compliance officer from the Occupational Safety and Health Administration ("OSHA"), the Secretary issued citation 2, which alleged, as amended, that Respondent committed a serious violation of the Act in failing to comply with section 1910.132(a) in that:

> Protective equipment was not used where it was necessary by reason of hazards encountered in a manner capable of causing injury or impairment in the function of any part of the body:
>
> > Employees were required to work on top of molds and to work near open sided floors without appropriate personal protective equipment. Such work consisted of banding

> boxes to molds, operating a pendant controlled crane, and pouring sand in the preparation of molds, which exposed employees to falling onto cluttered flatbed rail cars and the ground level approximately twelve feet below.

This citation was based on the compliance officer's observation of two employees of Respondent working on a platform known as the "hot top station," which was approximately 12 feet above the ground. The compliance officer testified that the employees had no fall protection as they prepared large empty molds to be filled later with molten steel. The molds rested on railroad flat bed cars that brought them to and took them away from the hot top platform. During certain phases of the mold preparation process, employees were required to step over a gap from the platform onto the top of the molds, thereby assertedly exposing themselves to the danger of a 12-foot fall. The compliance officer further testified that the employees could have been protected by safety belts, attached by 6-foot lanyards to a jib mechanism or column on the platform.

Following the presentation of the Secretary's case, Respondent moved to dismiss the case on the ground that section 1910.132(a) does not require the furnishing or use of safety belts. At the close of the presentation of its case, Respondent renewed its motion. In his decision, Judge Maxwell granted Respondent's motion to dismiss. He concluded that section 1910.132(a) does not apply to safety belts because they are not "named along with the protective clothing, respiratory devices, protective shields and barriers that are mentioned." He further held that section 1910.132(a) does not apply to falling hazards. Judge Maxwell stated, "The hazard of falling is sufficiently alien to the facial thrust of the regulation, that if there had been an intention to include it, then certainly it would have been mentioned along with 'processes' hazard, 'environmental' hazard, 'chemical' hazard, 'radiological' hazard and 'mechanical' hazard." He found support for his interpretation of section 1910.

132(a) in decisions by other administrative law judges who had concluded that the standard did not apply to safety belts and falling hazards, particularly noting that in John Zink Co., 79 OSAHRC 73/F10 (No. 78-1834, 1979 ALJ), the judge relied in part on evidence that the Secretary had instructed his representatives to no longer cite employers under section 1910.132(a) for failure to use safety belts.

II

The Secretary argues on review that the judge erred in interpreting the list of items in the cited standard following the phrase "protective equipment, including" as exclusive rather than illustrative. According to the Secretary, the language of the standard, when given its plain meaning, does not exclude safety belts, lifelines, and lanyards, but instead includes them because they comprise a form of "personal protective equipment," as indicated in the construction industry standard at 29 C.F.R. § 1926.104. The Secretary further contends that the hazard of falling from the hot top platform onto a railway car or the concrete floor is a hazard "of processes or environment" that could result in bodily injury. In addition, he correctly notes that the decisions of administrative law judges relied upon by Judge Maxwell in his decision are not binding on the Commission. 2/ The Secretary requests that the decision be remanded to the judge to resolve the remaining factual issues.

On review, Respondent urges affirmance of Judge Maxwell's decision. It states that, in determining that section 1910.132(a) is not applicable to safety belts and falling hazards, the judge relied on the well-recognized doctrine of expressio unius est exclusio alterius, i.e., express mention in a statute of one thing excludes others not expressed, which applies to section 1910.132(a)

---

2/ E.g., Leone Construction Co., 76 OSAHRC 12/E6, 3 BNA OSHC 1979, 1975-76 CCH OSHD ¶ 20,387 (No. 4090, 1976).

because that standard "clearly specifies various types of protective equipment and hazards but omits reference to safety belts, or to falling hazards." Arguing that this doctrine is strengthened when an item omitted in the cited standard is mentioned in another standard, Respondent lists OSHA standards explicitly requiring the use of safety belts in the ship repairing, shipbuilding, and construction industries. Respondent notes the decisions by other administrative law judges relied upon by Judge Maxwell, especially the one that relied in part on evidence of OSHA Instruction CPL 2-1.13 (April 16, 1979) in which the Secretary instructed his compliance officers to discontinue citing employers under section 1910.132(a) for failure to use safety belts and lines.

III

In Ed Cheff d/b/a Ed Cheff Logging, 81 OSAHRC 60/A2, 9 BNA OSHC 1883, 1981 CCH OSHD ¶ 25,431 (No. 77-2778, 1981), appeal filed, No. 81-7493 (9th Cir. July 27, 1981), the employer argued that 29 C.F.R. § 1910.132(a) does not require the use of seat belts to protect tractor operators from being crushed if the vehicle rolls over. The Commission held that, under the standard, the broad phrase "hazards of processes or environment" includes a rollover hazard created by operation of tracked logging vehicles over uneven terrain. Furthermore, the Commission concluded that seat belts, the suggested protective equipment, can be required under section 1910.132(a) because the use of the term "including" in the standard indicates that the enumerated types of protective equipment are merely illustrative rather than limitations on the scope of the standard. In addition, the Commission found no indication that the drafters of the standard otherwise intended to exclude the use of seat belts from the standard's requirements. Similarly, in United Geophysical Corp., 81 OSAHRC 77/D6, 9 BNA OSHC 2117, 1981 CCH OSHD ¶ 25,579 (No. 78-6265, 1981), appeal filed, No. 81-4342 (5th Cir. Aug. 26, 1981), the Commission concluded that, although the types of hazards

covered under the standard are limited to hazards of injury resulting from "absorption, inhalation, or physical contact," these categories are sufficiently broad to include the hazard of drowning. The Commission also determined that flotation devices can be required under the standard, even though they are not specifically mentioned, again because the list of protective devices at section 1910.132(a) is illustrative and cannot be construed as a limitation on the scope of the standard.

Applying this reasoning to the case before us, Commissioner Cottine and I conclude that the hazard of falling from the hot top platform is a hazard of processes or the environment within the meaning of section 1910.132(a) because the platform is where Respondent's employees stand when making "hot tops" and is thus part of the work surroundings of Respondent's employees. Similarly, we find no indication that the drafters of this provision intended to exclude from the scope of this standard equipment to protect against this hazard -- specifically, safety belts and lanyards. Furthermore, the section 1910.132(a) limitation to hazards "encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact" is sufficiently broad to include the hazard of injury or death by falling. Here, for example, injury could be sustained as a result of "physical contact" with a flatbed rail car or with the concrete floor due to a fall. 3/

---

3/ With regard to the Secretary's instruction to cease citing safety belt violations under section 1910.132(a), which was noted by Judge Maxwell in his decision and by Respondent on review, the Commission has held that the Secretary's internal administrative directives lack the force and effect of law and are thus not binding on the Secretary or the Commission. C. R. Burnett and Sons, Inc., 80 OSAHRC 111/A2, 9 BNA OSHC 1009, 1980 CCH OSHD ¶ 24,964 (Nos. 78-1103 & 78-1105, 1980), pet. den., No. 81-7057 (5th Cir. Feb. 6, 1981); FMC Corp., 77 OSAHRC 153/D4, 5 BNA OSHC 1707, 1977-78 CCH OSHD ¶ 22,060 (No. 13155, 1977). In any event, when the Secretary issued his instructions in CPL 2-1.13, he stated that he was doing so because of adverse decisions by Commission judges vacating § 1910.132(a) citations; he did not expressly or impliedly acknowledge the correctness of those decisions.

Accordingly, Commissioner Cottine and I conclude that the standard may properly be read to encompass a requirement that safety belts and lanyards be used to protect against a fall hazard, and it is therefore applicable in the instant case.

IV

Although section 1910.132(a) applies to the cited circumstances, I deny the Secretary's request for a remand and conclude that the citation should be vacated because Respondent was not given sufficient notice of the standard's applicability to fall hazards and safety belts. First of all, the requirements of the standard are set forth in broad, general language necessitated by "the myriad conceivable situations which could arise and which would be capable of causing injury." Ryder Truck Lines, Inc. v. Brennan, 497 F.2d 230, 233 (5th Cir. 1974). Thus, the standard itself did not clearly apprise Respondent that it was required to provide safety belts to employees exposed to falling hazards. Secondly, Respondent introduced evidence that the steel industry has not interpreted the cited standard as requiring use of safety belts and does not require safety belts for employees working on mold yard platforms. In addition, the Commission has not until now considered the issue of whether section 1910.132(a) requires safety belts for falling hazards, and the majority of unreviewed decisions by Commission administrative law judges on this issue have held that section 1910.132(a) would not apply to such protective equipment and such a hazard. Although these unreviewed judges' decisions are not binding upon the Commission, see note 2 supra, they created the appearance of a "pattern of administrative enforcement" that failed to give Respondent adequate notice that the standard applied to safety belts and the hazard of falling. See Diebold, Inc. v. Marshall, 585 F.2d 1327, 1336 (6th Cir. 1978). Moreover, as noted by the judge and Respondent, the Secretary has in the past issued a directive

concluding that the standard did not require the use of safety belts. Therefore, in order to give Respondent "the full benefit of the notice denied," I conclude that the citation should be vacated. See Diebold, Inc. v. Marshall, supra, 585 F.2d at 1339; Auto Sun Products Co., 81 OSAHRC 71/E14, 9 BNA OSHC 2008, 1981 CCH OSHD ¶ 25,808 (No. 77-2616, 1981), appeal filed, No. 81-3503 (6th Cir. Aug. 28, 1981).

Citation 2, which alleges noncompliance with section 1910.132(a), is vacated.

IT IS SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: MAR 31 1982

ROWLAND, Chairman, concurring in the disposition:

I agree with Commissioner Cleary's decision to vacate the citation, but for different reasons than those set forth in his opinion. In my view, section 1910.132(a) does not apply to this case because safety belts and lanyards do not constitute the type of personal protective equipment contemplated by that standard.

It is a well-established tenet of regulatory construction that in order to effectuate the intent of the drafter and provide fair notice to the reader, an undefined term, such as "protective equipment" in the cited standard, should be given its commonsense, plain meaning in light of the context in which the term is used. See S.J. Groves & Sons Co. v. OSHRC, No. 80-4201 (2d Cir. May 1, 1981); 2A Sutherland Statutory Construction §§ 47.16, 47.17 (4th ed. 1973).

Section 1910.132(a) explains that "protective equipment" includes "personal protective equipment for eyes, face, head and extremities, protective clothing, respiratory devices and protective shields and barriers." The protective measures listed as "protective equipment" are all the same type: each shares, among other things, the salient quality of restricting or blocking external agents, objects, or substances encountered at the workplace from coming into contact with the employee. Similarly, the personal protective equipment required by the other standards in Subpart I also function as filters or barricades. 4/ For example, sections 1910.133(a)(1) and (a)(3) refer to goggles to block flying objects, glare, liquids and radiation. See also § 1910.134 (respirators), § 1910.135 (helmets), § 1910.136 (safety-toe footwear), § 1910.137 (rubber gloves). Thus, the context in which the term "protective equipment" is used indicates that "protective equipment" means devices which serve as barricades or filters against external agents.

---

4/ Section 1910.132(a) is codified in Subpart I, titled "Personal Protective Equipment."

By contrast, safety belts reduce or eliminate potential falls by restraining and restricting the employee himself, rather than barricading or filtering external substances. Moreover, no mention is made of safety belts or similar devices which restrain an employee in either section 1910.132(a) or the other standards in Subpart I. 5/ While the word "including" in section 1910.132(a) shows that the standard is not limited exclusively to the devices listed, it would be inconsistent with the plain thrust of section 1910.132(a), and indeed all of Subpart I, to hold that the cited standard encompasses substantially dissimilar personal protective equipment, such as safety belts and lanyards. Cf. General Electric v. OSHRC, 583 F.2d 61 (2d Cir. 1978).

The majority reasons that the standard evidences no affirmative indication that the drafters of section 1910.132(a) intended to exclude safety belts and lanyards from the scope of the standard. However, the majority's reasoning renders the standard unenforceably vague. Standards cannot be construed to mean what the drafters might have intended but did not express; occupational safety and health standards must give employers fair notice of what is required for compliance. Bethlehem Steel v. OSHRC, 573 F.2d 157 (2d Cir. 1978), Diamond Roofing Co. v. OSHRC, 528 F.2d 645 (5th Cir. 1976). See Owens-Corning Fiberglass Corp. v. Donovan, 659 F.2d 1285 (5th Cir. 1981). Since safety belts are substantially different from the devices referred to in section 1910.132(a), an employer is not, in my view, given fair notice that safety belts constitute the type of protective equipment contemplated by section 1910.132(a).

---

5/ I note that Subpart D, another subpart of the general industry standards in Part 1910, is directed toward various falling hazards associated with potentially dangerous walking-working surfaces, such as open-sided platforms and floor openings. However, I need not at this time consider the question of whether Subpart D contains the exclusive requirements regarding fall protection for general industries.

Moreover, contrary to what the majority suggests, the word "environment" as used in section 1910.132(a) does not mean general "work surroundings" in my view. The types of protective equipment referred to in the cited standard and in Subpart I - such as respirators and eye goggles - indicate that the phrase "hazards of . . . environment" concerns hazards such as climatic or air-borne hazards, not hazards of all physical surroundings. In this regard, a fall hazard is not the type of hazard suggested by section 1910.132(a) and the other provisions in Subpart I.

Therefore, while I agree with the majority that a fall could result in injury by "physical contact," I conclude that section 1910.132(a) does not require safety belts and lanyards to reduce potential fall hazards. Because section 1910.132(a) is thus inapplicable to the present case, I would affirm Judge Maxwell's decision to vacate the citation.

COTTINE, Commissioner, dissenting in part:

There has been no showing that Bethlehem was deprived of fair notice as a matter of law that safety belt protection is within the ambit of 29 C.F.R. §1910.132(a). Accordingly, I would remand for a decision on the merits.

I

Commissioner Cleary bases his conclusion that Bethlehem was denied adequate notice of the requirements of section 1910.132(a) on Diebold, Inc. v. Marshall, 585 F.2d 1327 (6th Cir. 1978). In Diebold the court concluded that the due process clause of the Fifth Amendment was violated because two machine guarding standards failed to provide constitutionally adequate warning of the conduct required. The court found that no substantial notice problem was presented based on the mere fact that the standard relied on by the Secretary, 29 C.F.R. §1910.212(a)(3)(ii), was broadly worded. "Thus, if our concern here were merely the non-specificity of the regulation, there would be little room for debate." 585 F.2d at 1336.

The court concluded that the cumulative effect of several additional factors yielded a finding of inadequate notice. First was the "inartful drafting" of another standard, 29 C.F.R. §1910.217(a)(5), which arguably created a specific exemption for the cited machines (press brakes). 585 F.2d at 1336-37. Second was the undisputed "common understanding and commercial practice" relative to press brake guarding. The court concluded that the average employer would be unaware that the requirements applied to press brakes. Third was the pattern of administrative enforcement; a clear majority of Commission judges had held that the cited standard was inapplicable to press brakes. "Whether an employer looked to the language of the regulations or to industry practice, it would have been led to believe that press brakes had been specifically

exempted from guarding requirements." 585 F.2d at 1337 (citation omitted). However, the court noted that if Diebold had been aware of the standards' requirements it could not complain of an inadequate warning to others. 585 F.2d at 1337, citing United States v. Raines, 362 U.S. 17, 21 (1960). Thus, the Diebold analysis was based on a factual record.

The Diebold court also stated that the lack of adequate notice does not automatically lead to vacation of the citation. The court recognized that "there are probably cases in which an order such as the present one could properly be treated as severable, with enforcement denied on due process grounds only in relation to the penalties for past conduct." Id. at 1338-39 (citation omitted). The sole basis for vacating the entire citation in Diebold was that the inadequate notice also deprived the employer of the opportunity to seek a variance from the standard's requirements and thus an opportunity to establish its asserted defense of impossibility of compliance. Moreover, the Diebold court expressly limited its holding to "the particular 'facts of the case at hand'." Id. at 1338, citing United States v. Mazurie, 419 U.S. 544 (1975).

II

The facts in this case are significantly different and the principles applied in Diebold lead to a finding of fully adequate notice here. The cited standard, 29 C.F.R. §1910.132(a), though a broadly worded standard, "appears to have been drafted with as much exactitude as possible in light of the myriad conceivable situations which could arise and which would be capable of causing injury." McLean Trucking Co. v. OSAHRC, 503 F.2d 8, 10 (4th Cir. 1974), quoting Ryder Truck Lines, Inc. v. Brennan, 497 F.2d 230, 233 (5th Cir. 1974). Although §1910.132(a) does not explicitly mention safety belt protection, safety belts are a well-known, widely-used form of personal protective equipment. See, e.g.,

National Safety Council, Accident Prevention Manual for Industrial Operations, 1185-1190 (6th ed. 1973). The personal protective equipment provision of the construction industry standards, 29 C.F.R. §1926.28, specifically incorporates provisions concerning safety belts, lifelines and lanyards.[1/] "Both regulations [§§1910.132(a) and 1926.28] require the use of personal protective equipment, such as safety belts, when necessary to protect against hazards such as falling." Turner Communications Corp. v. OSAHRC, 612 F.2d 941, 944 (5th Cir. 1980) (dictum). Thus, if our concern is merely the non-specificity of §1910.132(a), there is little room for dispute that it provided adequate notice of its requirements. Also, unlike Diebold, there are no seemingly inconsistent provisions in this case that reasonably could mislead an employer attempting to comply.

---

1/ Subpart C - General Safety and Health Provisions

§1926.28 Personal protective equipment.

(a) The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees.

(b) Regulations governing the use, selection, and maintenance of personal protective and lifesaving equipment are described under Subpart E of this part.

* * *

Subpart E - Personal Protective and Life Saving Equipment

* * *

§1926.104 Safety belts, lifelines, and lanyards.

(a) Lifelines, safety belts, and lanyards shall be used only for employee safeguarding. Any lifeline, safety belt, or lanyard actually subjected to inservice loading, as distinguished from static load testing, shall be immediately removed from service and shall not be used again for employee safeguarding.

(b) Lifelines shall be secured above the point of operation to an anchorage or structural member capable of supporting a minimum dead weight of 5,400 pounds.

[The remaining provisions of the standard, which merely contain required specifications for safety belts, lifelines and lanyards, are omitted here.]

Bethlehem presented evidence at the hearing that the steel industry did not interpret §1910.132(a) to require the use of safety belts. This is a factual issue on which the judge has not ruled because he disposed of the case on the general applicability issue. The Secretary did not brief this issue and was not on notice to brief it under the direction for review. Thus, Bethlehem's evidence on the steel industry's interpretation is not properly relied on for purposes of this appeal. However, even assuming that Bethlehem is correct regarding the industry's interpretation, the reasons put forward for that interpretation have been rejected. We may not decline to enforce a standard merely because an industry has interpreted it erroneously.

Furthermore, the Respondent was not deprived of fair notice of the applicability of §1910.132(a) to safety belts by prior Commission decisions. Bethlehem points to three unreviewed judges' decisions issued before the alleged violation in this case in which §1910.132(a) was held inapplicable to safety belts.[2/] However, there were also at least two unreviewed judges' decisions before that time finding violations of §1910.132(a) based on lack of proper safety belt protection.[3/] Moreover, the unreviewed

---

2/ Belau Transfer and Terminal Co., 78 OSAHRC 28/B5, 6 BNA OSHC 1592, 1978 CCH OSHD ¶22,681 (No. 76-4631, 1978)(ALJ Mitchell); Union Oil Co. of California, 78 OSAHRC 21/E4, 6 BNA OSHC 1433, 1978 CCH OSHD ¶22,614 (No. 76-2784, 1978)(ALJ Mitchell), aff'd on other grounds, 616 F.2d 1113 (9th Cir. 1980); Northwest Bridge and Tank Co., 73 OSAHRC 1/C7, 1 BNA OSHC 3025, 1971-73 CCH OSHD ¶15,342 (No. 1113, 1972)(ALJ Morris). Bethlehem also points to two decisions issued after the alleged violation in this case. John Zink Co., 79 OSAHRC 73/F10, 7 BNA OSHC 2019, 1979 CCH OSHD ¶23,853 (No. 78-1834, 1979) (ALJ Morris); Robberson Steel Co., 79 OSAHRC 1/A2, 7 BNA OSHC 1195, 1979 CCH OSHD ¶23,256 (No. 76-4636, 1979)(ALJ Cronin). However, subsequent decisions could not affect Bethlehem's understanding on the date of the alleged violation.

3/ Sun Ray Lighting Co., 77 OSAHRC 17/B7, 5 BNA OSHC 1071, 1975-76 CCH OSHD ¶20,732 (No. 14580, 1976)(ALJ Burroughs); Technical Tubing Testers, Inc., 78 OSAHRC 34/B13, 6 BNA OSHC 1615, 1977-78 CCH OSHD ¶22,724 (No. 77-1525, 1978)(ALJ Bullis).

decisions of Commission judges are without precedential value and may not be relied on as the Commission's view of the law. Leone Construction Co., 76 OSAHRC 12/E6, 3 BNA OSHC 1979, 1975-76 CCH OSHD ¶20,387 (No. 4090, 1976).[4/] Consistent with the remedial purposes of the Act, the Commission should not decline enforcement of a citation, including the abatement of any hazards that may exist, simply because there is no authoritative interpretation of the standard by the three-member Commission.

Commissioner Cleary also relies on OSHA Instruction CPL 2-1.13 (April 16, 1979). See lead opin., pt. IV. That instruction directed compliance officers no longer to cite employers under §1910.132(a) for failure to wear safety belts. However, that internal administrative instruction was issued after the alleged violation in this case, and thus does not show that Bethlehem was deprived of fair notice of the standard's requirements with respect to this citation. Also, the instruction does not conclude that §1910.132(a) does not require safety belts. Instead, it represents a policy decision based on certain adverse decisions by Commission judges. See lead opin., n. 3.

---

4/ In a Commission decision issued in 1975, Commissioner Cleary expressed the view that §1910.132(a) required safety belts. Colorado Fuel and Iron Steel Corp., 75 OSAHRC 67/A2, 3 BNA OSHC 1289, 1974-75 CCH OSHD ¶19,729 (No. 594, 1975). There as here the alleged fall hazards concerned work on railroad cars, and the employees were not provided with safety belts and lifelines. The judge had vacated an alleged §1910.132(a) violation on the ground that the standard is unenforceably vague as applied to the conditions involved. His decision was upheld without precedential effect because the two sitting Commissioners differed in their disposition of the case. Commissioner Cleary's views in that case are significant:

> Assuming arguendo that the Commission has authority to consider the validity of a standard, Commissioner Cleary considers that any question as to the constitutional validity of 29 C.F.R. Sec. 1910.132(a) to be now well-settled. McLean Trucking Co. v. OSAHRC [supra]; Ryder Truck Lines v. Brennan [supra]. . . . Commissioner Cleary expresses the hope, if not the expectation, that the respondent will take voluntarily corrective measures. Moreover, in his view, the Secretary of Labor may reinspect under section 1910.132(a) . . . .

3 BNA OSHC at 1290-91, 1974-75 CCH OSHD at p. 23,538.

In addition, the Secretary has not had a fair opportunity on review to address the factual issue of whether Bethlehem actually was aware of the applicability of §1910.132(a) to safety belts. The Diebold analysis was made on a factual record. The Secretary contended below that Bethlehem admittedly had used safety belts in the mold yard area in the past. This contention is relevant to whether Bethlehem actually knew safety belts are required there. Owens Corning Fiberglass Corp., 79 OSAHRC 26/D6, 7 BNA OSHC 1291, 1979 CCH OSHD ¶23,509 (No. 76-4990, 1979), aff'd, 659 F.2d 1285 (5th Cir. 1981). Thus, this case should not be vacated on notice grounds in reliance on Diebold without a complete factual record.[5/]

III

In summary, there has been no showing that Bethlehem was deprived of fair notice regarding the application of §1910.132(a) to safety belts as a matter of law. Factual issues are not before us at this time and should be resolved by the judge on remand in the first instance. The remaining issues include whether a reasonable person familiar with the factual circumstances surrounding the allegedly hazardous condition, including any facts unique to Bethlehem's industry, would recognize a hazard warranting the use of personal protective equipment. E.g., Owens Corning Fiberglass Corp., supra. This universal "reasonable person" test eliminates any notice problems of a constitutional dimension. United States v. Petrillo, 332 U.S. 1 (1947); Ryder Truck Lines, Inc. v. Brennan, supra. Accordingly, this case should be remanded for a decision on the merits of the citation.

---

5/ Auto Sun Products Co., 81 OSAHRC 71/E14, 9 BNA OSHC 2008, 1981 CCH OSHD ¶25,808 (No. 77-2616, 1981), appeal filed, No. 81-3503 (6th Cir. Aug. 28, 1981), cited by Commissioner Cleary to support vacation of the citation, is inapposite. There, as in Diebold, there was a misleading standard which we found failed to put the Respondent on notice of the standard's requirements. However, there are no misleading provisions here depriving Bethlehem of fair notice of the cited standard's requirements.

| SECRETARY OF LABOR, | : | |
| Complainant, | : | |
| v | : | OSHRC Docket No. 79-0310 |
| BETHLEHEM STEEL CORPORATION, | : | |
| Respondent. | : | |

## OPINION AND ORDER

These proceedings were initiated by the complainant (Secretary) on January 9, 1979, by the issuance of a citation charging the respondent Bethlehem Steel Corporation (Bethlehem) with several violations of the Occupational Safety and Health Act. The citation relates to conditions that came to the attention of an OSHA compliance officer during an inspection December 21, 1978 conducted in the mold yard of Bethlehem's steel processing plant in Chesterton, Indiana.

A partial settlement agreement disposed of all of the case except one alleged serious violation. A hearing on this surviving issue was held September 26 and 27, 1979, in Chicago.

The Secretary was represented in these proceedings by Attorney Christopher D. Wolfe of the Office of the Solicitor, Department of Labor, Chicago. Bethlehem was represented by Attorney Mark Floyd Reynolds, II, of Bethlehem, Pennsylvania.

The one item that went to hearing relates to an alleged violation of the safety standard published at 29 CFR 1910.132(a). That standard is in the following language:

> Protective equipment, including personal protective equipment for eyes, face, head, and extremities, protective clothing, respiratory devices, and protective shields and barriers, shall be provided used, and maintained in a sanitary and reliable condition wherever it is necessary by reason of hazards of processes or environment, chemical hazards, radiological hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact.

The citation charges that an infraction of provisions of this standard occurred as follows:

> Protective equipment was not used where it was necessary by reason of hazards encountered in a manner capable of causing injury or impairment in the function of any part of the body:
>
> Employees were required to work on top of molds and to work near open sided floors without appropriate personal protective equipment. Such work consisted of banding boxes to molds, operating a pendant controlled crane, and pouring sand in the preparation of molds, which exposed employees to falling onto cluttered flatbed rail cars and the ground level approximately twelve feet below.

At the conclusion of the Secretary's case-in-chief, Bethlehem moved for dismissal upon the grounds that 29 CFR 1910.132(a) "does not require furnishing or use of safety belts." (T 96) After both sides had rested, the motion was renewed. At that time, grounds for dismissal

were expanded. Counsel asserted the standard was so vague that it contained insufficient notice of what was required. (T 173) The Secretary requested time to brief these issues. Such request was allowed, and briefing was completed December 10, 1979.

A short recital of the facts may help to bring the dismissal motion into perspective. In Bethlehem's mold yard, the compliance officer observed two employees on a platform approximately 12 feet high. (T 22) This was called the hot top station. (T 109) He testified the employees did not have any fall protection as they worked to prepare large empty molds to be filled with molten steel. This preparation involved affixing a metal box and an umbrella-like contraption upon the top of the mold. (T 27) Sand was then placed in the umbrella and solidified by infusion of carbon dioxide. (T 160)

The molds rested on railroad flat bed cars that were used to transport them to and from the hot top platform. Certain phases of the work required the employees to take a short step from the platform onto the top of the molds. This meant stepping a horizontal distance of 12 to 18 inches, and a vertical distance ranging up to 10 inches (T 29) No one has ever fallen from the platforms or molds. (T 49)

The Secretary contended that these work conditions presented a falling hazard which 29 CFR 1910.132(a) required the employer to abate by means of safety belts. As above indicated, respondent asserts that not only is the standard void for vagueness, but that its language does

not permit a construction that would encompass safety belts. Bethlehem raised other defenses, including that of hazard enhancement, but they are not germane to the present motion.

Analysis of the standard has brought me to the view that the constitutional challenge need not be confronted, because I find that the regulation was inappropriate as the basis for the citation. The subject standard was not aimed at fall protection. No mention is made of safety belts. Nothing is said about falling hazards. It is silent regarding protection from injuries from falls. The hazard of falling is sufficiently alien to the facial thrust of the regulation, that if there had been an intention to include it, then certainly it would have been mentioned along with "processes" hazard, "environmental" hazard, "chemical" hazard, "radiological" hazard and "mechanical" hazard. Or safety belts would have been named along with the protective clothing, respiratory devices, protective shields and barriers that are mentioned. The failure to mention under these circumstances signifies an intention not to include.

This view has found favor with those OSHRC judges who have been confronted with the same issue.[1] In Sec. v John Zink Company, 7 OSHC 2019 (1979), Judge Morris, in declaring the subject standard did not require use of safety belts, significantly noted that the Secretary has prohibited further use of that standard for safety belt cases. See also Sec. v Robberson Steel Co., 7 OSHC 1195 (1979); Sec. v Belau Transfer, 6 OSHC 1592 (1978); Sec. v Union Oil Co., 6 OSHC 1433 (1978); Sec. v Northwest Bridge and Tank Company, 1 OSHC 3025 (1973).

---

1 There have been instances where safety belt violations have been upheld under 132(a). However, in those cases the question of the applicability of the standard to safety belts was never raised. Sec. v Technical Tubing Testers, 6 OSHC 1615 (1978); Sec. v American Window Cleaning Co., 5 OSHC 1583 (1977) (Citation vacated on other grounds); Sec. v Sun Ray Co., 5 OSHC 1071 (1977)

## ORDER

For the reasons set forth above, the respondent's motion for dismissal is granted, and Item 1 of Citation No. 2 and the proposed penalty are in all things VACATED.

| SECRETARY OF LABOR, | : | |
| Complainant, | : | |
| v. | : | OSHRC Docket No. 79-5329 |
| DURIRON CO., INC., | : | |
| Respondent. | : | |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

CLEARY, Commissioner:

An order of Administrative Law Judge J. Paul Brenton approving a settlement agreement between the parties is before the Commission under section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). The principal issue on review is whether the judge erred in entering that order. I would find that he did not err.

The Respondent, Duriron Co., Inc., operates a foundry, in Dayton, Ohio, that was inspected by an Occupational Safety and Health Administration ("OSHA") compliance officer. As a result of that inspection, the Secretary of Labor ("the Secretary") issued two citations to Respondent, the first alleging a serious violation of the Act in that Respondent failed to comply with 29 C.F.R. § 1910.132(a) and the second alleging a repeated violation of section 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1). Respondent contested both of these citations and the accompanying

proposed penalties. After a complaint and an answer had been filed, but before a hearing was held, the parties entered into a settlement agreement resolving all of the disputed issues in this case. The record establishes that the parties properly served and notified affected employees, who filed no objections to the agreement. The settlement agreement was summarily approved by Judge Brenton, who entered an order effectuating the terms of the agreement.

My views on the proper role of the Commission in the settlement process are fully set forth in my separate opinions in Farmers Export Co., 80 OSAHRC 66/A2, 8 BNA OSHC 1655, 1980 CCH OSHD ¶ 24,569 (No. 78-1708, 1980), and Nashua Corp., 80 OSAHRC 121/A2, 9 BNA OSHC 1113, 1981 CCH OSHD ¶ 25,020 (No. 78-2146, 1980).

Applying my views in those cases to this case, I conclude that the settlement agreement before us should be approved.

The judge's order approving the settlement agreement is affirmed.

IT IS SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: MAR 31 1982

ROWLAND, Chairman, concurring:

I agree that the settlement agreement should be approved. In the circumstances of this case I believe that the Review Commission should not review the substance of a settlement agreement where the Secretary and the Respondent have reached an agreement and no affected employees or their representative challenge the sufficiency of the abatement date. Marshall v. Sun Petroleum Products Co., 622 F.2d 1176 (3d Cir. 1980), cert. denied 449 U.S. 1061 (1980). See Oil, Chemical and Atomic Workers v. OSHRC, No. 81-1687 (D.C. Cir. Feb. 26, 1982).

COTTINE, Commissioner, dissenting:

A settlement agreement that alters or waives a statutory duty under the Act is inconsistent with the provisions and objectives of the Act and is contrary to the public interest. "It is a necessary adjunct of the Commission's public interest and supervisory role [over the Act's enforcement] that settlement agreements that do not comport with the purposes of the Act be rejected." Farmer's Export Co., 80 OSAHRC 66/A2, 8 BNA OSHC 1655, 1656, 1980 CCH OSHD ¶24,569, p. 30,080 (No. 78-1708, 1980) (Cleary, Commissioner). See John Deere Foundry, 81 OSAHRC 14/B9, 9 BNA OSHC 1351, 1354, 1981 CCH OSHD ¶25,218, pp. 31,145-6, (No. 78-5498, 1981). The proposed settlement agreement in this case does not provide for the abatement required under the cited standard and therefore should be rejected.

I

An inspection of the Respondent's foundry in Dayton, Ohio resulted in the issuance of a citation alleging a serious violation of 29 C.F.R. §1910.132(a) on the grounds that "[f]ull body protective equipment/clothing designed to provide protection against molten metal was not provided and worn [by employees tending the furnaces]." In settlement, the Secretary and the Respondent, Duriron Co., Inc., ("Duriron"), proposed the following:

> 9. Abatement for Citation No. 1 shall be accomplished by provision of Ammonia cured pants and coats or other full body personal protective equipment of the same material to the induction furnace operators and first helpers. Said personal protective equipment is in addition to the eye, face, hand and foot protection, provided by Respondent to induction furnace operators and first helpers prior to August 20, 1979.
>
> 10. Any violation of 29 C.F.R. 1910.132(a) will not be considered as a repeated violation based on the Citation No. 1 of this case, unless Respondent fails to comply with Paragraph 9 in providing personal protective equipment, as defined in Paragraph 9, for furnace operators and first helpers to protect against the danger of splashing molten metal.

Review was directed under 29 U.S.C. §661(i) and Commission Rules 92(a) and (d), 29 C.F.R. §§2200.92(a), (d), on the following issues: (1) Whether paragraphs 9 and 10 above are consistent with the provisions and objectives of the Act, (2) whether paragraphs 9 and 10 limit the Respondent's obligation to comply with the requirements of 29 C.F.R. §1910.132(a) that protective equipment "be provided, used, and maintained," and (3) whether the judge erred in approving a settlement agreement containing the limitations set forth in paragraphs 9 and 10.

II

Workplace injuries and illnesses exact a heavy toll in terms of both human and economic loss. In passing the Occupational Safety and Health Act, 29 U.S.C. §§651-678, Congress "place[d] pre-eminent value on assuring employees a safe and healthful working environment." American Textile Manufacturers Institute, Inc. v. Donovan, 101 S.Ct. 2478, 2506 (1981). The Commission encourages the settlement of enforcement actions arising under the Act. However, when strong public interests are involved in a legislative attempt to correct public harm, "[t]he interests involved are far broader than those of the particular parties in a particular lawsuit . . . [and] the parties cannot be permitted to settle for less than, or for more than, the facts of the case and public policy expressed in . . . [the statute] mandate." Patterson v. Newspaper & Mail Deliverers' Union of N.Y. & Vicinity, 384 F.Supp. 585, 588 (S.D.N.Y. 1974), aff'd, 514 F.2d 767 (2d Cir. 1975), cert. den. sub nom. Larkin v. Patterson, 427 U.S. 911 (1976).

Commission Rule 100(a), 29 C.F.R. §2200.100(a), provides in pertinent part that "[a] settlement proposal shall be approved when it is consistent with the provisions and objectives of the Act." Section 5(a)(2) of the

Act, 29 U.S.C. §654(a)(2), requires each employer to "comply with occupational safety and health standards promulgated under this Act." 1/ The cited standard specifically requires that personal protective equipment be "provided, used, and maintained in a sanitary and reliable condition." An employer's duty under the standard is not satisfied by merely providing appropriate equipment. Lukens Steel Co., 81 OSAHRC 96/A2, 10 BNA OSHC 1115, 1124, 1981 CCH OSHD ¶25,742, p. 32,120 (No. 76-1053, 1981) and cases cited. The use of provided equipment must be enforced. Astra Pharmaceutical Products, Inc., 81 OSAHRC 79/D9, 9 BNA OSHC 2126, 2130, 1981 CCH OSHD ¶25,578, p. 31,900 (No. 78-6247, 1981), appeal filed, No. 81-1672 (1st Cir., Sept. 23, 1981); The Budd Co., 74 OSAHRC 12/A2, 1 BNA OSHC 1548, 1973-74 CCH OSHD ¶17,387 (Nos. 199 & 215, 1974), aff'd, 513 F.2d 201 (3d Cir. 1975). In contrast to the requirements of the cited standard, paragraph 9 of the agreement states that abatement "shall be accomplished by provision of . . . personal protective equipment." This limitation on the employer's compliance responsibilities is reinforced by paragraph 10 which states that any subsequent violation of the cited standard will not be considered repeated unless Duriron fails to provide personal protective equipment for the designated employees.2/ The stipulated limitation on Duriron's statutory duty to comply with the requirements of a safety standard promulgated under the Act is inconsistent

---

1/ An employer seeking a variance from a promulgated standard must demonstrate by a preponderance of the evidence that alternative safety measures "to be used by an employer will provide employment and places of employment to his employees which are as safe and healthful as those which would prevail if he complied with the standard." 29 U.S.C. §655(d).

2/ Whether the parties interpret their agreement in a manner different from what I view as an impermissible limitation on an employer's statutory duty is unknown since the Commission, over my dissent, declined to receive briefs on the directed issues in this case.

with the Act's specific duty clause, 29 U.S.C. §654(a)(2),[3/] and the Act's stated purpose of assuring "so far as possible every working man and woman in the Nation safe and healthful working conditions." 29 U.S.C. §651. Accordingly, it is inconsistent with the settlement approval criteria in Commission Rule 100(a), 29 C.F.R. §2200.100(a), that a settlement proposal be "consistent with the provisions and objectives of the Act."

The proposed settlement should be rejected.[4/]

---

3/ The limited abatement provision in this agreement is also inconsistent with the Act's variance provision, supra note 1, because it permits less than full compliance with a promulgated standard without the employer's assurance that working conditions will be "as safe and healthful as those which would prevail if he complied with the standard." 29 U.S.C. §666(d).

4/ The limitation on future repeated violations contained in paragraph 10 of the agreement is inconsistent with Commission law regarding repeated violations under 29 U.S.C. §666(a) and provides another basis for rejecting the agreement. See Farmer's Export Co., supra (Cottine, Commissioner, dissenting)

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

An order of Administrative Law Judge Edward A. Bobrick is before the Commission pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678. Judge Bobrick dismissed the Secretary of Labor's charges with prejudice upon the motion of the Secretary. The motion was submitted pursuant to a settlement agreement between the parties by which the Secretary agreed to withdraw the charges with prejudice and D.F. Goldsmith Chemical and Metal Corporation agreed to undertake certain abatement measures.

However, the settlement agreement did not include a certification showing that it was posted to give notice to the affected employees. See Commission Rule 100(c), 29 C.F.R. § 2200.100(c). Accordingly, we affirm the judge's order[1/] upon the condition that the parties submit a certifi-

1/ Upon his own motion, Commissioner Cottine directed review on two issues, one concerning service upon affected employees and the other

(continued on next page)

cation to the Executive Secretary showing that the settlement agreement has been posted (Commission Rule 7, 29 U.S.C. § 2200.7)[2/] and upon the condition that affected employees are afforded at least ten (10) days following posting to comment on or object to the settlement. The certification must be submitted within fifteen (15) days of the issuance of this order. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: MAR 31 1982

---

1/ (continued)

concerning the parties' failure to state specific dates by which abatement will be accomplished. In Commissioner Cleary's view, inasmuch as the Respondent has agreed to substantial abatement measures in the settlement agreement, and has agreed to study other suggested measures, the settlement comports with his position as set out in his dissenting opinion in Nashua Corp., 80 OSAHRC 121/A2, 9 BNA OSHC 1113, 1981 CCH OSHD ¶ 25,020 (No. 78-2146, 1980)

Chairman Rowland concludes that the Commission should not look beyond the terms to which the parties have agreed and therefore the Commission should not require the parties to state any particular abatement terms. See Marshall v. Sun Petroleum Products Co., 622 F.2d 1176 (3rd Cir.), cert. denied, 101 S.Ct. 784 (1980). Accordingly, Chairman Rowland agrees with Commissioner Cleary that the settlement agreement should not be disapproved because of the lack of specific dates by which abatement will be accomplished.

2/ Respondent's employees are not represented by an authorized employee representative. Accordingly, service by posting is sufficient.

COTTINE, Commissioner, concurring:

The majority correctly concludes that the Secretary's motion to dismiss "was submitted pursuant to a settlement agreement between the parties." Thus, the settlement agreement in this case is before the Commission pursuant to our review of the judge's order granting the Secretary's motion to dismiss. In this unique procedural posture, the specific requirements of Commission Rule 100(b)[1/] are not controlling as to whether the judge's order should be affirmed.[2/] Nevertheless, the Respondent has entered into an agreement by which it makes specific abatement commitments and further commits itself to additional means of controlling mercury exposure in its workplace. That agreement and its attachments are the basis for the Secretary's motion and are incorporated into the judge's order. Under these circumstances the agreement is

---

1/ Commission Rule 100(b), 29 C.F.R. §2200.100(b), provides:

> (b) Requirements. Every settlement proposal submitted to the Judge or Commission shall include, where applicable, the following:
>
> (1) A motion to amend or withdraw a citation, notification of proposed penalty, notice of contest, or petition for modification of abatement;
>
> (2) A statement that payment of the penalty has been tendered or a statement of a promise to pay; and
>
> (3) A statement that the cited condition has been abated or a statement of the date by which abatement will be accomplished.

2/ The typical settlement agreement submitted to the Commission for approval is a bargained for exchange between the parties that ultimately affirms in part a citation issued by the Secretary. Compare, e.g., Consolidated Edison Co. of New York, 81 OSAHRC 9/B2 9 BNA OSHC 1267, 1981 CCH OSHD ¶25,165 (Nos. 80-999 & 80-1252, 1981) (settlement resulting in affirmance of citation but modifications of characterization and penalty) with Consolidated Aluminum Corp., 80 OSAHRC 125/A2, 9 BNA OSHC 1144, 1981 CCH OSHD ¶25,069 (No. 77-1091, 1980), petition for review filed, No. 81-3079 (6th Cir. Feb. 16, 1981)(citation withdrawn). See also, Power Systems Division, United Technologies Corp., OSHRC Docket No. 79-1552 (Jan. 13, 1982)(ALJ DeBenedetto)(one citation vacated in consideration of abatement measures by the respondent; one citation affirmed). The settlement agreement before the Commission in this case does not affirm in any part the citation issued by the Secretary.

consistent with the Act's provisions and objectives as generally required by Commission Rule 100(a).[3/] Accordingly, I concur in affirming the judge's order granting the motion, conditioned upon posting and an opportunity for affected employees to be heard, John Deere Foundry, 81 OSAHRC 14/B9, 9 BNA OSHC 1351, 1981 CCH OSHD ¶25,218 (No. 78-4449, 1981).

---

3/ Commission Rule 100(a), 29 C.F.R. §2200.100(a), provides in part, "A Settlement proposal shall be approved when it is consistent with the provisions and objectives of the Act."

NOTICE OF DECISION

Secretary of Labor v. Mobil Oil Corporation
OSHRC Docket No. 80-6678

1. Enclosed is a copy of my decision. It will be filed with the Commission on March 1, 1982, and will become the final order of the Commission on March 31, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is March 31, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

## DECISION AND ORDER

SCHWARTZ, Judge:

This is a proceeding brought before the Occupational Safety and Health Review Commission ("The Commission") pursuant to Section 10 of the Occupational

Safety and Health Act of 1970, 29 U.S.C. §651 et. seq. ("the Act"). Respondent contests an alleged willful violation of Section 5(a)(1) of the Act.

An inspection was commenced at Respondent's workplace on August 12, 1980. Mobil timely contested the subject citation. A hearing was held in this matter on June 11 & 12, 1981 in Beaumont, Texas. The Oil, Chemical, and Atomic Worker's International Union, hereinafter the "Union" appeared on behalf of the affected employees. Complainant and Respondent have filed post-hearing briefs.

Respondent concedes that it is engaged in a business affecting commerce within the meaning of the Act and that the Commission has jurisdiction of the parties and of the subject matter. The issues remaining to be decided are twofold. First whether Respondent was in willful violation of Section 5(a)(1) of the Act. If so, the appropriate penalty therefor.

The citation provides as follows:

> Section 5(a)(1) of the Occupational Safety and Health Act of 1970:
> The employer did not furnish employment and a place of employment which were free from recognized hazards that were causing or were likely to cause death or serious physical harm to employees, in that:
>
> (a) the employer did not protect employees from the recognized hazard of oxygen deficiency posed by working within a confined space. The employer could have protected his employees by means such as testing confined space atmospheres prior to employee entry. Testing should insure safe concentrations of oxygen and absence of dangerous or harmful air contaminants. Only those employees who are properly trained and equipped, (i.e. respiratory protection, life lines, etc. when necessary) should be allowed to enter confined spaces. Employees were exposed to the hazard of oxygen deficiency in areas such as the Number 2 tank car loading area.

## Evidence

Mr. Joseph Chaisson appeared and testified. He has been employed at Mobil Oil for 39 years. His job is to load tank cars at loading rack number 2. Mr. Chaisson checks the tank cars for cleanliness by looking in the car. He then

notifies the pump house to start loading the car. A gauge indicates when the car is full and the pumphouse is notified to stop the loading procedure. He samples the oil and seals the car. The tank car is picked up by train and distributed to the buyer. The cars are returned after delivery of the lube oil and the above procedure is again followed (T. 23-28).

On August 12, 1980, three employees entered a tank car at loading rack number 2 and passed out from oxygen deficiency. Mr. Chaisson testified that prior to this date Mobil did not require any specific procedures before entering the tank cars at loading rack number 2. Mr. Chaisson was not told about the danger of oxygen deficiency in tank cars prior to this date. A stock oil is loaded into the tank cars. He did not enter every tank car in August 1980. It was unusual to enter the cars because they were built in a different way now. He would not go into a car that had a danger placard on it indicating poison was in the tank car or gas of any kind (T. 27; 30-32; 39).

Mr. Jodie Kimbrough appeared and testified. He has been Mobil's operations supervisor at the lube plant for the past five years. He is responsibile for the shipping and receiving of lube oils. He primarily oversees the transfer of lube oil from one storage tank to another. Mr. Kimbrough is responsible for the loading of tank cars in the lube plant. A checklist is followed which includes inspection of all connections and making sure the tank car itself is clean. The tank cars are inspected by having an employee look into the hatch. An employee is required to stand up on the ladder when an employee is required to enter the tank car (T. 44-47;R's Exh 2).

Mr. Kimbrough has observed employees entering tank cars at loading rack number 2 prior to August 12, 1980. They did not need an entry permit to enter the

cars prior to this date. He was under instructions to always have entry permits before entering confined spaces. He testified that a tank car is a confined space as is any closed vessel. Nevertheless prior to August 12, 1980, an entry permit was not required to enter the lube oil tank cars. The company's policy was not to require a safety permit to enter the tank cars because nobody ever assumed one was necessary because of the product being pumped. The cars were dedicated to lube oil which has no toxicity and a very low flash point. Prior to August 12, 1980, he did not know how the lube oil tank cars were unloaded at their point of destination. He did not know nitrogen pressure was being used to purge the tank cars. Mr. Kimbrough has never heard of any employee either getting nauseated or passing out after entering tank cars dedicated to lube oil (T. 45-52).

Mr. Eugene Reeves also appeared and testified. He worked as the operations superintendent in Respondent's lube plant prior to his retirement. He supervised Mr. Kimbrough at Mobil and was operations supervisor in August 1980. He stated that tank cars were inspected on an infrequent basis prior to August 12, 1980. These inspections were for mechanical defects and cleanliness. Employees did enter the tank cars at various times. Tests were made for hydrocarbons, i.e., explosive tests were made to detect hydrocarbons. These were the only tests he is aware of on the tank cars and they occurred around 1970. They ran no tests for odors in the tank cars. They tested every car but were not going to enter every car. The tests were made simply to determine if there were any hydrocarbon vapors in the air to be sure there was nothing in the lube tank cars that would cause an explosion during loading. Oxygen deficiency tests were not conducted. Respondent was not concerned about entry into the tank cars. The tests were stopped when they found no evidence of explosive mixtures in the lube cars (T. 54-57; 61-62).

Mr. Reeves also indicated that he is a chemical engineer. He testified that nitrogen is odorless and tasteless. He was never notified by Mobil's Customer Rohm and Haas that they were using nitrogen to unload the lube tank cars which Mobil delivered to Rohm and Haas. He indicated that if notified Respondent would have invoked strict precautions before entering the lube cars (T. 61-62). He also stated that safety checks were used before entering storage tanks and vessels at Mobil. A safety man would check for explosive vapors and oxygen deficiency. In addition a safety overseer would stand by when a vessel was entered. These checks were not required of the lube oil tank cars because he saw no reason to have oxygen deficiency or any hazardous thing in a tank car in lube service. No employee had ever passed out in a lube car prior to August 12, 1980. Lube oil is a 100 second neutral oil similar to mineral oil. It is a base stock and Mobil uses it to blend with other oils (T. 62-64).

Mr. Reeves did not ask Rohm and Haas about their unloading procedure prior to the accident on August 12, 1980. He indicated that tank cars are commonly unloaded by pumping them out with suction. He was aware that Mobil had policies and procedures concerning the entering of confined spaces. Management did not feel they applied to lube tank cars. It had been Mobil's policy for years to enter lube tank cars. The policy concerning entry into confined spaces did apply to the tank cars at the refinery that contained gasoline and products like that. The practice concerning entering lube tank cars was never mentioned as an exception to the confined spaces rule. It was a practice that grew up over the years because it had never been necessary to test these cars (T. 63-67; 71; Joint Exh. 1).

Mr. Lyman Limbocker testified. He is presently employed by Mobil as Manager of Safety and Security for the Beaumont Refinery. He has held this position since the first of June 1980. He is supervisor over the safety department

at Mobil as a whole. He was not actually present at the refinery until July 1, 1980. He reviewed Mobil's procedures contained in Tabs 5 and 6 of Joint Exhibit 1. He indicated that if asked he would have interpreted the procedures concerning confined spaces entry to apply to lube oil tank cars. He based this opinion on the fact that the procedures deal with confined spaces and lube oil tank cars are confined spaces. He did not know the history of the lube cars at the Beaumont Refinery. After the accident of August 12, 1980, the safety department notified the management of the lube plant that their personnel could not enter tank cars without a permit. This included lube oil tank cars. He had no personal knowledge about any exceptional practice that had grown up around the subject lube oil tank cars (T. 79-82).

Mr. Rod Lide appeared and testified. He is presently Manager of Materials, Distribution and Contracts for Rohm and Haas, Deer Park, Texas. The raw materials buyers report to him as well as the traffic supervisor. Traffic control is the shipment of Rohm and Haas goods out of the plant and the shipment in of raw materials. The General Service Department also reports to him. They unload tank cars, prepare them for shipment and release them to the traffic department for return to the original shipper. Mr. Lide has a degree in chemical enginering (T. 84-85).

Rohm and Haas is a large chemical complex of approximately 1,000 acres. They are big in the field of acrylates. Rohm and Haas makes a lot of oil additives, the ingredient that gives oil its viscosity improvement. It is a typical chemical industry. The activities of this plant bear no relationship at all to the petroleum refining industry. They are a customer of the refining people (T. 85).

Mr. Lide indicated he has knowledge about what happens to tank cars which come into Rohm and Haas from outside companies. He stated that Mobil is a

reasonably long-term supplier to Rohm and Haas of lubricating or dilution oils. Prior to August 12, 1980, these oils were supplied by Mobil in rail tank cars. Rohm and Haas had been receiving these tank cars at one particular spot in the plant for approximately a year and a half prior to August 12, 1980 (T. 88). They received approximately 20-30 cars a month from Mobil. Upon arrival Rohm and Haas' buyer would designate where the car was to be unloaded and give directions to the train crew where to spot the car. The car would then be unloaded and prepared for shipment back to the supplier. The two areas where the cars were unloaded are referred to as the "K" process and the "F-2" area. Ninety per cent of the cars received from Mobil were unloaded at the "F-2" area (T. 89).

The "F-2" area was set up to pressure the material out of the tank car. Nitrogen was used to pressure the tank cars because it was available at this unloading spot. The car was unloaded by the pumper hooking up a nitrogen line to the top of the tank car. He would hook up the discharge line to the bottom of the tank car and apply nitrogen pressure to the internal sides of the tank car. He would open the valve and the internal pressure would push out the oil into the storage tank. The pumper knew the tank car had been emptied when he could hear the nitrogen going through the bottom drain where the oil had been pushed out. At that point he would close the valves, turn off the nitrogen, bleed the car back to atomospheric pressure, close everything up and prepare the car for shipment back to the supplier. The car is still filled with nitrogen when it is shipped back to a supplier such as Mobil (T. 89-91).

The other part of the plant ("K") unloads tank cars by use of a suction pump which is hooked up to the bottom outlet of the tank car. Rail cars are also unloaded at numerous other spots throughout the plant. They pressure off the cars

to unload them at many of these spots. Sometimes they use plant air to pressurize off a car (T. 91-92).

Mr. Lide stated that they inspect tank cars occasionally for defects and also do some tank car cleaning. It is necessary to enter the cars for these purposes. Rohm and Haas requires the safety department to check all tank cars for explosive readings and oxygen levels before employees may enter these tank cars. He also indicated that his company has never placed any placard or other warning sign on tank cars that have been pressured off with nitrogen prior to returning them to the original shipper (T. 94-96; 101).

Mr. Henry Guillory appeared and testified. He was an oil mover at Mobil lube rack for 38 years prior to his retirement on September 1, 1980. He described the events surrounding his passing out in a tank car on August 12, 1980 at Mobil's lube rack number 2. He arrived at work and began preparing the tank cars for loading of lube oil. He dropped the bottom valves of the tank cars and noticed that the pin from one of the tank cars was out of its slot. The pin runs from the top of the tank car to the bottom and is used to open the valves at the bottom while standing on the top of the cars. Mr. Guillory informed Mr. Chaisson that the pin needed realignment and then placed a ladder in the tank car and entered. A co-worker Ms. Gerry Adams kept watch over him as he worked in the tank car. Mr. Guillory remembers going into the car and putting the pin in place before passing out inside the tank car (T. 124-126; 128-132; 135).

The tank car involved in the accident was tank car ACFX88987. Mobil Oil safety inspector, Aubrey Shafer, took readings for the oxygen content inside tank car ACFX88987 at approximately 8:30 a.m. on August 12, 1980. This was after the accident. He recorded an oxygen content level of 8%. Tests were again taken by Mobil Oil safety inspectors inside tank car ACFX88987 at approximately 9:30 a.m.,

on August 12, 1980, which indicated an oxygen content level inside the tank car of 10 1/2%. Safety Inspector Ronnie Falcon of Mobil also ran tests on several tank cars subsequent to the accident. These tests of tank cars at the number 2 loading rack indicated a range of 12-15% oxygen content inside the cars. He was not testing to enter the cars (T. 138-141; 144; Admissions number 2, 11, & 12). Exposure of employees to oxygen deficient atmospheres is likely to cause serious physical harm (T. 114).

The Secretary's Compliance Officer Mike Adams conducted an investigation into the accident. He interviewed Mr. Hunter Jaggard, Respondent's Lube Plant Manager as well as several employees. Mr. Adams testified that Mr. Jaggard told him he was aware of Respondent's safety policies and procedures that a tank car was a confined space. Mr. Jaggard told the compliance officer that he did not agree with that determination and felt that based upon his experience with lube oil the policies did not apply to entry of lube tank cars (T. 148-149).

Mr. Hugh Short appeared and testified. He has been a safety foreman at Mobil for the last three and a half years. Prior to that he was a safety inspector. His duties include the supervision of fifteen safety inspectors along with three other safety foreman. He trains the inspectors and audits their jobs in seeing that they are performing in accordance with company standards (T. 13-15). Mr. Short also handles requests for entry permits into confined spaces. A particular department calls him and requests an entry permit. He dispatches an inspector to run several tests including a test for oxygen content. If all requirements are met he issues a permit to enter the confined space (T. 15).

He testified that the procedures set forth in Mobil Safety Operating Procedures (Joint Exh 1, Tabs 5 & 6) were in effect at the Beaumont Refinery on August 12, 1980. It was his interpretation in his role of safety foreman that the safe

work permit procedures applied to tank car entries including testing for potential oxygen deficiency before entering lube tank cars. He believed these procedures applied prior to August 12, 1980. The procedures to enter confined spaces would apply because the lube rack number 2 tank cars were confined spaces (T. 17; 21-22).

Mobil runs an oxygen test on all confined spaces when an entry permit is involved. If a safety inspector gets a reading down to 20% oxygen, he will not issue an entry permit. This reading would indicate oxygen deficiency to a safety inspector. The inspector would turn the job down. A safety foreman can approve entry into a confined space down to 16% but he has never approved anything below 20%. The procedures provide that if entry is allowed between 16%-20%, special equipment such as breathing air protection and a safety overseer is required (T. 18-19). Mr. Short testified that there was an entry permit procedure into confined spaces at Mobil's Beaumont Refinery in effect prior to August 12, 1980. The safety department issued 156 entry permits into confined spaces during July 1980. Oxygen deficiency tests were conducted. This was a representative month (T. 166-167).

He also testified that the company has several safety training programs in effect at the Beaumont Refinery. These include an 8 hour course on the safe operating procedures manual and a written test at the end of the lesson. Safety meetings are conducted once a month. These meetings include the use of films such as one entitled "Two Breaths" on entry into a confined space. Weekly toolbox meetings are held. Programs for safety inspectors are conducted each Friday. The purpose is to keep the inspectors updated and trained. In addition the company has a new employee orientation program. This 16 hour program discusses a multitude of topics including chemical handling, safe work habits, confined spaces and request for entry permits. The film on confined spaces is shown (T. 171-176).

Mr. Short also described the sequence of events that occurred on August 12, 1980, at lube rack number 2. He went down to the lube rack after hearing an ambulance call on his office monitor. When he arrived at loading rack number 2, he spoke to the pumper Mr. Welch. Mr. Short was told there were three people down in the tank car. He asked Mr. Welch for a Scott-Air Pack, received it, put it on and went down the stairway at loading rack number 2 (T. 177-178).

When Mr. Short arrived at tank car ACFX-88987 he found Mr. Irwin there. He looked into the tank car and observed they had a red rubber hose near the car. Mr. Short questioned Mr. Irwin as to whether it was a steam or air hose and was informed it was an air hose. He instructed Mr. Irwin to put the yard air hose into tank car ACFX-88987 over Henry Guillory, Gerry Adams, and Wayne Moye (T. 178-179).

Mr. Short attempted to enter the tank car with the Scott-Air Pack on his back. He could not get in the tank car because the manway was too small. The bottle of air was taken off his back and it was held up above him so he could attempt to enter the car a second time. His air mask got hung on the ladder rung and was pulled off his face. He breathed something that upset him and had him coughing. Mr. Short came out of the tank car and breathed two or three whiffs of oxygen (T. 179).

Mr. Short noticed that there was a breathing air trailer at the scene of the accident with a smaller mask. He put it on, attached a lifeline to himself and made a successful entry. He tied a rope on Mr. Moye and signaled to the persons at the top of the hatchway to pull Mr. Moye out. The rope was lowered back into the tank car after Mr. Moye was pulled out into a safe area. He then tied the rope to Mr. Guillory and at the same time accidentally tied his fresh air mask hose in with the rope. When Mr. Guillory was pulled out, Mr. Short's fresh air mask was pulled off.

The mask was lowered back into the tank car. Mr. Short was not able to pull the rubber bands of the mask over his head. He removed himself from the scene when he knew he had become ineffective by signaling to be removed from the tank car. Another person replaced him and pulled Ms. Adams out (T. 179-180).

Mr. Merlin Clark appeared and testified. He is Plant Manager for Mobil's lube plant at St. Louis, Missouri. He has been with Mobil for 37 years. He indicated that lube oil is unloaded at his facility. It is shipped up from the Beaumont Refinery in rail tank cars from time to time. He unloads the cars by use of a suction hose and a pump from the bottom. Mr. Clark testified that all Mobil lube plants employ this method of unloading tank cars (T. 191-192).

Mr. Wayne Moye appeared and testified. He is an operator at Mobil's Beaumont Refinery and has worked for Mobil for 37 years. On August 12, 1980, he noticed Mr. Guillory laying in the bottom of the tank car. He told Ms. Adams that he would go for help. When he returned to the car he observed Ms. Adams inside the tank car laying over Mr. Guillory. His head was under the lube oil. He told the people around him that he was going in the tank car to get Ms. Adams off of Mr. Guillory. He entered the car (T. 200-202).

Mr. Moye indicated that he has had occasion to go in lube oil cars on very rare occasions in the past. He has had occasion to go into other types of tanks and vessels around the refinery. He gets a safety permit before entering any of these vessels or tanks. Mr. Moye indicated that Ms. Adams returned to work (T. 202-203).

Mr. Elton Williams testified that he is traffic manager at Mobil's Beaumont Refinery. His job is to track the movement of the rail cars coming in and going out

of the refinery. This includes tank cars dedicated to lube oil. He gave a history of tank car number ACFX88987. The car left the refinery 14 times in 1980. It left seven times to go to Rohm and Haas, five times to another Mobil installation, once to another customer, and one time it left empty. The tank car was dedicated to lube oil (T. 209-210).

Mr. Gerald Christopher testified that he is a safety supervisor at Mobil's Beaumont Refinery. He previously was a safety inspector. Mr. Christopher conducted tests of the lube tank cars several years ago. The tests were not for oxygen deficiency. Rather he was testing for vapors to be certain there were no explosive vapors in the tank cars. They were concerned that the movement of product, at that time, could create a static electricity spark. The tests were not performed as a preliminary step to an employee entering the tank cars. He normally checked every car at the loading rack (T. 220-223).

Mr. J. D. Theall testified that he has worked at the blending and packaging plant of the Beaumont Refinery since 1940. He has a loading rack referred to as number 9 in his work area. He loaded all types of motor oils and industrial oils at his loading rack in August 1980. They were loaded into rail tank cars. The products are all toxic. Prior to entering any tank car his procedure was to secure an entry permit from the safety department (T. 224-225).

Mr. Burl Martin testified that he has been employed as a boilermaker at Gulf Oil for 33 years. He is Chairman of the Union's Joint Health and Safety Committee. Mr. Martin testified that Gulf Oil has written procedures for entry into vessels. He receives copies of these procedures through his position on the safety committee. He testified that Gulf's procedures require the testing for oxygen deficiency prior to entry into enclosed vessels and tank cars. Gulf Oil has a lube oil tank car loading rack. It also dedicates tank cars to lube oil (T. 227-231).

## OPINION

### 5(a)(1) RECOGNIZED HAZARD

In order to establish a section 5(a)(1) violation, the Secretary must show that: (1) an employer failed to render its workplace free from a recognized hazard; (2) the occurrence of an incident was reasonably foreseeable; and (3) the likely consequence in the event of an incident was death or serious physical harm to its employees. Bomac Drilling, Division of TRG Drilling Corp., 81 OSAHRC 45/A2, 9 BNA OSHC 1681, 1691, 1981 CCH OSHD ¶25,363 at p. 31,547 (No. 76-450, 1981). The Secretary must also demonstrate that there were feasible means available to abate the hazard. National Realty and Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973).

A recognized hazard is a condition or practice in the workplace that is known to be hazardous either by the industry in general or by the employer in particular. Beaird-Poulan, A Division of Emerson Electric Co., 79 OSAHRC 21/D11, 7 BNA OSHC 1225, 1979 CCH OSHD ¶23,493 (No. 12600, 1979). Furthermore, it is the hazard, not a specific incident that resulted in injury, which is relevant in determining the existence of the recognized hazard. See Brennan v. OSHRC, (Vy Lactos Laboratories, Inc., 494 F.2d 460 (8th Cir. 1974); Boeing Co., Wichita Division, 77 OSAHRC 188/D13, 5 BNA OSHC 2014, 1977-78, CCH OSHD ¶22,266 (No. 12879, 1977).

Respondent contends that the hazard in this case was not a "recognized" hazard within the meaning of Section 5(a)(1). In this regard Respondent contends that the evidence shows there was in fact no oxygen deficiency hazard associated with tank cars dedicated to lube oil. Respondent's argument focuses on the fact that the oxygen deficiency came about as a result of the injection of nitrogen into the subject tank car by Rohm and Haas without the knowledge of the Respondent.

Respondent's statement of the hazard emphasizes the cause of the particular accident at lube rack number 2. I find this to be an unreasonable narrowing of the hazard in this case. I agree with the Complainant and the Union that the hazard in this case is an oxygen deficient atmosphere in a confined space. The confined space is the tank car which was entered without a permit by Respondent's employees. It is this danger that must be addressed in deciding whether the condition or practice was known by the industry in general or by the employer in particular to be hazardous.

The record reveals that Mobil recognized the danger presented by an oxygen deficient atmosphere in a confined space under the circumstances of this case. Respondent's own safety policies and procedures in effect on August 12, 1980, recognized tank cars as confined spaces. These procedures point out that one of the hazards posed by a confined space is oxygen deficiency. They require that before an entry is made into a confined space, tests must be conducted for oxygen deficiency.

Respondent's safety program also establishes the fact that it recognizes that an oxygen deficient atmosphere in a confined space is a hazard. Every employee goes through a two day program in which Mobil policies concerning confined spaces are emphasized. The program stresses the dangers of confined spaces. In addition Respondent utilizes the film "Two Breaths" which addresses confined space entries.

Finally, all witnesses recognized the danger of oxygen deficiency in confined spaces such as tank cars. The only disagreement was the belief by some that an exception had grown up around the tank cars dedicated to lube oil. This aspect of the case is relevant to the issue of the proper classification of the citation. However, as noted above, the fact that the subject tank car was dedicated to lube oil and Rohm and Haas used nitrogen to unload it, does not change the hazard

involved here. In fact the record supports a conclusion that the danger of oxygen deficiency in confined spaces at issue here is a matter of common knowledge as well as recognized by Mobil in particular. Thus the record establishes the existence of a recognized hazard at Respondent's worksite.

Furthermore I find that an incident involving this hazard was reasonably foreseeable and the likely result of an incident would be death or serious injury. Respondent was aware that its employees entered tank cars to perform their assigned duties at lube rack number 2. The Secretary need not prove the foreseeablity of the accident as it actually happened with regard to the unloading of the tank car by Rohm and Haas. Rather it is sufficient to show the foreseeability of the general hazard of an oxygen deficient tank car being entered without checking for oxygen deficiency. This was reasonably foreseeable in this case. Respondent has stipulated that exposure of employees to an oxygen deficient atmosphere is likely to cause serious physical harm.

I also find that a feasible means of abatement was available. There was a means of abatement which would materially reduce the hazard. The Respondent's own policies and procedures in effect on August 12, 1980, are feasible in this case. They need only be enforced at lube rack number 2 to abate the hazard of oxygen deficiency in confined spaces. Respondent has in fact applied these procedures to the lube tank cars at loading rack number 2 since the accident on August 12, 1980. Accordingly the Secretary has satisfied his burden of proof with respect to each of the elements of a violation of Section 5(a)(1) of the Act.

## Characterization of the Violation

The Commission characterizes a violation as "willful" if it was committed with either an intentional disregard of, or plain indifference to, the Act's requirements. Mel Jarvis Construction Co., Inc., OSHRC Docket No. 77-2100 (RC

September 30, 1981). The Secretary's burden of proving willful conduct is notably more difficult when an employer is charged with a willful violation under a general standard or "the general duty clause," section 5(a)(1), rather than a specific standard. St. Joe Minerals Corp. d/b/a/ St. Joe Lead Co. v. OSHRC & Marshall, 647 F.2d 840 (8th Cir. 1981). In particular, a more concrete evidentiary showing is required to prove willfulness in this context. Where a willful violation of section 5(a)(1) is alleged, the Secretary has the burden of proving the employer's intentional disregard of or its plain indifference to its statutory duty to furnish a workplace free from recognized hazards that are causing or likely to cause death or serious physical harm. Thus there must be evidence, apart from that establishing knowledge of the hazard, from which I may reasonably conclude that the employer intentionally disregarded or was indifferent to the safety of the workplace. Id at 848-849.

The Secretary's main contention is that Respondent intentionally disregarded and/or showed plain indifference to the very broad duty to furnish its employees a place of employment free from oxygen-deficient atmospheres in confined spaces. The Secretary emphasizes that Respondent had notice that its employees were entering lube oil tank cars without prior testing of the oxygen content.

I have reviewed the record and conclude that the Secretary has failed to carry its burden of proof that Mobil intentionally disregarded or was plain indifferent to its statutory duty under Section 5(a)(1) of the Act. I cannot reasonably conclude from the total evidence of record, that the employer intentionally disregarded or was indifferent to the safety of the workplace. My reasons follow.

This is not a case where the Respondent was completely indifferent to the safety of its employees with respect to entry into confined spaces. The record

establishes that Respondent had an extensive safety training program which emphasized the dangers of confined spaces. It had new employee orientation as well as films on the subject. Training was conducted on a regular basis. In addition the safety department issued 156 entry permits in the month of July 1980 alone.

This case involves an exception to Mobil's confined space procedures which required that no vessel could be entered without an entry permit obtained from the safety department. Tests for oxygen content are run before such a permit is issued. This procedure was not followed at the lube plant with respect to cars dedicated to lube oil. The exception grew up over the years and was based on the belief that lube oil presented no hazard. Lube plant management and employees alike shared this opinion because lube oil is non-toxic and similar to mineral oil. No employee prior to August 12, 1980, had ever become nauseated or passed out in a tank car dedicated to lube oil.

Lube plant management also required that a safety checklist be followed before entering the cars. Personnel at loading rack number 2 had on occasion entered the tank cars for many, many years. This was usually done because of a cleanliness problem or a malfunction. Mobil's employees were only familiar with the suction pump unloading of tank cars which was the exclusive way of unloading at the Beaumont Refinery. They had no knowledge or warning that Rohm and Haas, a chemical industry member, was unloading the cars by the use of nitrogen gas pressure which resulted in an oxygen deficiency inside the car. Finally, after ascertaining the cause of the accident, the Respondent promptly expanded its safety testing procedures for entry into tanks and vessels to specifically include tank cars in lube service. Lube plant management personnel were advised accordingly.

Respondent's total confined space entry program was good. Its basic assumptions and actions over the years were reasonable under the circumstances set forth above. I cannot conclude that there is sufficient evidence to base a finding that Respondent's efforts to discover that Rohm and Haas was using nitrogen gas were so inadequate as to constitute careless disregard of employee safety. In addition I find that the record does not establish Mobil's intentional disregard or its plain indifference to "the safety of the workplace" and its duty under section 5(a)(1) to provide a workplace free from recognized hazards that are likely to cause death or serious physical harm. Consequently, the violation of section 5(a)(1) of the Act is not willful.

I now turn to the assessment of an appropriate penalty in this case. The Secretary proposed a penalty of $2700 out of a possible $10,000 for the alleged willful violation. This penalty must be adjusted since I have found a serious violation of Section 5(a)(1) rather than a willful violation. The maximum penalty for a serious violation is $1,000.

Respondent is a very large corporation. The record reveals no history of previous violations. On the other hand I consider the gravity of this violation to be high. Three employees were exposed to an oxygen deficient atmosphere in a confined space. The duration of the exposure was long enough for them to be rendered unconscious before their rescue. There was a high probability that a serious injury would occur from the 5(a)(1) violation. On balance I conclude that a penalty of $900 is reasonable and appropriate in light of the record and the statutory penalty criteria set forth in Section 17(j) of the Act.

## FINDINGS OF FACT

1. On August 12, 1980, Respondent's lube plant employees were unloading a rail tank car dedicated to lube oil at the No. 2 loading rack of the Beaumont Refinery.

2. Three employees were injured when they entered a tank car at the No. 2 loading rack between 7:30 a.m. and 8:30 a.m. on August 12, 1980.

3. The oxygen content inside the tank car at approximately 8:30 a.m. on August 12, 1980, was 8%, and it was 10 1/2 % at approximately 9:30 a.m.

4. Respondent's safety policies and procedures in effect on August 12, 1980, required a 20% oxygen level in a confined space to permit work without special equipment.

5. Respondent's written safety policies and procedures define tank cars as confined spaces.

6. These same policies require the testing of tank cars for oxygen deficiency prior to entry and the issuing of a work permit.

7. The tank car in question was not tested prior to entry by the three employees to determine its oxygen content.

8. Exposure to an oxygen-deficient atmosphere in a confined space will cause or is likely to cause death or serious physical harm.

9. Respondent had actual knowledge that its employees were entering, on occasion, tank cars dedicated to lube oil without first securing an entry permit and testing for oxygen deficiency.

10. The tank car had been returned empty from Respondent's customer Rohm and Haas.

11. Rohm and Haas had unloaded the tank car with nitrogen gas pressure.

12. Respondent had no knowledge of the purging of the tank car by applying nitrogen gas pressure.

13. Respondent did not use such gas to unload tank cars and did not know of its use by others.

14. The lube oil loaded at the No. 2 loading rack was a neutral, non- toxic base stock type of oil similar to mineral oil.

15. Prior to August 12, 1980, no vessel at the refinery was entered by Respondent's employees without an entry permit except the tank cars in lube service.

16. The issuance of an entry permit requires several tests including one for oxygen content.

17. Respondent had an extensive safety training program which emphasized the dangers of confined spaces prior to August 12, 1980.

18. Prior to August 12, 1980, no employee had ever become nauseated or passed out after entering a tank car dedicated to lube oil.

19. Respondent did not intentionally disregard or show plain indifference to the safety of the workplace with respect to the entry of tank cars dedicated to lube oil without first requiring an entry permit under the circumstances of this case.

## CONCLUSIONS OF LAW

1. Respondent, Mobil Oil Corporation, is engaged in a business affecting commerce and has employees within the meaning of Section 3(5) of the Act. The Commission has jurisdiction of the parties and of the subject matter of this proceeding.

2. On August 12, 1980, Respondent was in serious violation of Section 5(a)(1) of the Act.

## ORDER

On the basis of the foregoing Findings of Fact and Conclusions of Law, it is ORDERED that:

1. Item 1(a) of willful citation number 1 is AFFIRMED as a serious violation.

2. A penalty of $900 is assessed for the aformentioned violation.

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

1515 Broadway, Room 3800
New York, New York 10036

NOTICE OF DECISION

Secretary of Labor v. NACLERIO CONTRACTING CO., INC.
OSHRC Docket No. 81-1524

1. Enclosed is a copy of my decision. It will be filed with the Commission on March 1, 1982, and will become the final order of the Commission on March 31, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is March 31, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

For Respondent

## DECISION AND ORDER

Fier, Judge

## PRELIMINARY STATEMENT

This is a proceeding pursuant to section 659 of the Occupational Safety and Health Act of 1970 (29 U.S.C. section 651 et seq., hereinafter called the Act), wherein Respondent, contests the citation and penalties for both the serious and repeat violations. The citation is dated June 3, 1981.

The citations and proposed penalties were issued pursuant to sections 9(a) and 10(a) of the Act.

Pursuant to section 10(c) of the Act, (29 U.S.C. section 659(c)) the Respondent, through its letter dated June 11, 1981, noted its timely contest to the citations and the proposed penalties.

The standards which were violated are set forth as 29 U.S.C. 654 section 5(a)(1); and 5(a)(2). Penalties totaling $1040.00 were proposed for the violations.

The citations alleged as follows:

Serious - Violation

1
29 CFR 1926.400(h)(1): Approved ground-fault circuit interrupter(s) or an assured equipment grounding conductor program was not used for the protection of employees using 120 volt, single phase, 15 and 20 ampere receptacle outlets that were not a part of the permanent wiring of a building or structure:

> Construction site outside of trailer office. Radial Skilsaw used with yellow extension cord plugged into trailer outlet, which received power from pole outside of trailer (Temporary wiring, extension cord and trailer outlet).

A penalty of $400.00 was proposed.

Repeat - Violation

1
29 CFR 1926.602(a)(9)(i): Bidirectional machine(s) were not equipped with an operable horn, distinguishable from the surrounding noise level:

> Construction site at 138th Street and 11th Avenue. Fiat payloader - license 8801-SD. Reverse signal alarm distinguishable from the surrounding noise level was not provided.

A penalty of $640.00 was proposed.

## ISSUES

The following issues are pertinent to a disposition of this case:

1. Did the Respondent fail to comply with the specific standards of the Occupational Safety and Health Act set forth above.

2. Did the Respondent violate any or all of the above standards previously so as to make the instant violation "Repeat."

3. If the Respondent is found to have violated any or all of the above, what penalty or penalties, if any, should be assessed for any of the violations of the Act.

## SUMMARY OF TESTIMONY

Mr. E. M. Hall, Compliance Officer (hereafter referred to as C.O.) with the U. S. Department of Labor since 1974, testified that he has been involved in the field of safety for 12 years. He has made 639 inspections, half of which

were involved with construction sites (Tr. 8).*

On May 28, 1981, he visited the subject worksite in College Point. He met with Mr. Joseph Naclerio who is a foreman, and noted that there was no shop steward available (Tr. 9). He proceeded to make his inspection in the accompaniment of Mr. Naclerio. The C.O. stated that he saw a radial saw with an extension cord going through a window of the work trailer to the saw (Tr. 11-12). Mr. Naclerio said that the employees worked for him (Tr. 12). The saw had no ground fault circuit interrupter (Tr. 13). The hazard involved is possible electric shock or electrocution (Tr. 12). The C.O. stated that he saw the Respondent's employees using the saw earlier (Tr. 12). The workers were identified by Mr. Naclerio (Tr. 12). The hazard could have been corrected by use of a ground fault interrupter or a program. The C.O. ascertained that the Respondent did not have a program (Tr. 13).

It was ascertained that there was no ground fault interrupter on the worksite (Tr. 13). The hazard was visible by observation. By questioning the employees he ascertained that there was no program.

The unadjusted proposed penalty of $500.00 was reduced by 20 percent to $400.00 (Tr. 14-15).

---

*Denotes transcript page.

The C.O. had a closing conference with the Respondent and Respondent said that he would have a job fault interrupter installed (Tr. 19).

Citation 2 is concerned with a repeat violation in which any bi-directional vehicle must have an audio reverse alarm pursuant to section 29 CFR 1926.602(a)(9)(i), (Exhibit C-1). The Respondent was operating the vehicle without the use of an alarm near where the Respondent's employees were working (Tr. 16). There was no alarm or other audio indication that the vehicle was moving back towards the employees. The danger was determined to be at the rear wheels (Tr. 16). The employees were from one to three feet from the vehicle (Tr. 17). Mr. Naclerio identified the employees as his (Tr. 17). The C.O. stated that he saw the vehicle going backwards without the alarm sounding a warning (Tr. 16). There were no precautions taken and the violation was observed by observation. It was ascertained that it was a repeat violation because the Respondent had previously been cited for the same violation and paid a reduced penalty (Tr. 18, Exhibit C-1).

A penalty of $400.00 x 2 equalled $800.00, minus 20 percent for good faith, resulting in an adjustment of the penalty to $640.00.

The Respondent introduced (Exhibit R-1), which was the C.O.'s inspection report (Tr. 21). On cross-examination it

was ascertained that the C.O. entered the trailer for the opening conference and did not see the wire in the trailer at that time. He later observed that the saw was hooked to an outlet in the trailer (Tr. 41).

In going from the trailer to the jobsite, the loader was working in another area. The C.O. saw the loader moving from area to area. The second time he saw the loader vehicle was when it was a block away with employees working around it and the backhoe was moving back and forth (Tr. 43). There were two employees in front of the machine and two to three employees in the rear with shovels (Tr. 46, 47). They were in and out of a trench and the machine was moving back and forward. The employees in front were about one foot from the bucket and the employees in the rear were several inches to one foot from the machine. The employees in the rear had their backs facing the machine and therefore, were not aware of when the machine was going to move back.

Respondent's Exhibit 2, is a publication on Fiat-Allis (Tr. 53). The employees in the rear were using shovels to fill an excavation trench. The machine was moving back and forth at about 2 miles an hour and traveled seven feet from the rear wheels with the employees' backs to the machine (Tr. 56, 57). The vehicle was said to be inches from the employees (Tr. 58). The C.O. made an observation with Mr. Naclerio standing alongside of him. He had a closing

conference and verified a broken window which was replaced (Tr. 64). The C.O. also discussed the other violations. The machine was observed and checked to see if it was functional. Mr. Naclerio said wires were not connected to the horn and he would see to it that it was fixed. The C.O. saw the vehicle parked and when it backed up the alarm was not working and there were no wire connectors to any audio alarm (Tr. 65).

Ralph Johnson, an employee of Naclerio for two years, and in construction for ten years, stated that he was a laborer and also worked as a signalman for a 645B payloader (Tr. 87). The duties of the signalman were described. He was working as a signalman on May 28 and May 29, 1981 (Tr. 89). He was using hand signals, but had no flag (Tr. 90). On May 27, 1981, he had the same duties as signalman (Tr. 90). The employees were not working in the trench that day. He further stated that the employees were not working with their backs to the machine (Tr. 92). It is alleged that the horn alarm was on the machine but was not sounding on May 28, 1981. He also indicated that he was the only one in back of the vehicle, the payloader, on that day acting as signalman (Tr. 97).

The witness stated that on May 28, 1981, he was a signalman for the payloader. He did not see the C.O. on that date. He said there was more than one Fiat loader on the worksite. The witness said there was no alarm, horn or buzzer that sounded when the machine was going back on the 27th (Tr. 99). Similarly,

on the 28th, there was no alarm, horn or buzzer (Tr. 100, 101). The witness said he was acting as signalman in place of the horn or alarm (Tr. 102).

The witness said that the machine may have been tampered with when children pull the wires out on the equipment (Tr. 140).

Mr. Joseph Naclerio testified that he is 22 years of age and has been a superintendent on the job (Tr. 152). He met with Mr. Hall on May 28, 1981 (Tr. 154). He first saw the C.O. as he was walking around the job after coming out of the trailer (Tr. 155). Later, he came back and introduced himself as the C.O. (Tr. 155). The C.O. came into the office and said he was there to inspect the job. Both men walked around the job together. It is stated that the job was pretty much completed at the time. There was a No. 645 payloader parked near the office, but not in operation (Tr. 158-159). The C.O. noticed the broken glass (Tr. 34, 159). This was explained to him and then the C.O. asked if the horn was working. The horn was not working. It was noted that the wires were pulled out and it was attributed to vandalism (Tr. 159). There were two locations where the Respondent was working on the same street. It is indicated that the machine was not in operation when they observed the machine together, referring to the Fiat No. 645. At the time, they were backfilling the excavation and saw the men working with the machine. It was not possible for anyone

to stand in the trench that goes to the center of the street. At that time the signalman is out in the street. A statement was made that the inspector may have told Ralph to tamp the trench. The signalman is always used with the machine and would act as a little "foreman" (Tr. 170). He would tell the operator what to do with the machine. It is stated that there was an air operated manual horn on the machine on May 28, 1981, that was operable. However, the backup alarm was not working because the wires were pulled by vandals (Tr. 174).

It is further stated that with regard to Respondent's Exhibit 2, there is a red mark showing where the floor button is located. The horn works off air pressure and the tank is connected to the brakes. The horn does not work when the motor is off. The direction of travel has nothing to do with the operation of the horn. It is manually operated (Tr. 177). It is further indicated that equipment on the worksite is damaged regularly due to vandalism (Tr. 174). The backup alarm on the No. 645 is located in the left bottom cover behind the radiator cover.

The witness stated that he saw Mr. Hall on the following day, Friday, at the closing conference and completed the inspection. Only the small backhoe was in operation at the time and the C.O. took pictures around the trailer. There was

an electrical cord going from the trailer to the saw outside (Tr. 182). There were no other electrical tools on the job and that if there was defective equipment, it would be promptly replaced. When the C.O. told the witness what a ground fault interrupter was, he then purchased one, but he stated he had no use for one after that date. On the date of inspection, the Respondent concedes there was no ground fault interrupter in use (Tr. 183). The C.O. did not ask if there was an approved plan. It is also stated by the witness that there was no special training necessary for a signalman (Tr. 184). There is a decal on the side of the machine giving instructions (Tr. 184). It is noted that it was not on the Fiat (Tr. 185). The witness did not see any employees within inches of the rear tire of the pay-loader. It is stated that Ralph, the signalman, has control and is to be obeyed. If there is a signalman, he is there to signal or to inform the workers that the machine is in reverse.

On cross-examination, it was established that there was no ground fault program (Tr. 188). The Secretary also elicited that pursuant to Section 1926.201(a)(3), where a signalman is provided, the regulations require the use of flags by the signalman (Tr. 189).

## OPINION

We are first concerned with the alleged serious violation of 29 CFR 1926.400(h)(1) relative to ground fault interrupters.

The record establishes that the Respondent admittedly did not have a ground fault interrupter in use. The record also shows that the Respondent admitted it did not have an approved plan in use at the time of the inspection. The Secretary's Exhibits C-2 and C-3 clearly show that the electric saw was in use on the worksite. It is the testimony of the C.O. that the hazard of electrocution is of sufficient consequence to render the hazard as serious. The evidence establishes that the workers using the electric saw were the Respondent's employees. The Respondent indicated it did not have an interrupter but would get one and use it.

On the basis of the evidence and the testimony, the Secretary has carried its burden of proof that the violation of the standard set forth above has been established.

The unadjusted proposed penalty of $500.00, was reduced to $400.00. After considering the evidence and testimony in the light of Section 17 of the Act, I am convinced that the proposed adjusted penalty is fair and reasonable.

We are next concerned with the alleged repeat violation of 29 CFR 1926.602(a)(9)(i) concerning the use of a bi-directional operable horn on the Respondent's payloader.

To prove a violation in the instant case, the Secretary must not only establish noncompliance with the standard to which condition employees had access, but knowledge on the

part of the employer of the condition constituting the violation. North American Rockwell Corp., 16 OSHRC 444, BNA OSHD 1710, aff'd sub. nom. Dunlop v. Rockwell Int'l., 540 F.2d 1283 (6th Cir. 1976). The applicable standard sets forth two alternatives in that, earthmoving equipment which has an obstructed view to the rear not be used in reverse gear unless there is in operation a reverse signal alarm distinquishable from the surrounding noise level or an employee signals that it is safe to do so. The standard states no preference for either alternative. Brown and Root, Inc., OSHRC Docket Number 76-3942, 8 BNA OSHD 1055, 1980 CCH OSHD ¶ 24,275. Nor does it mandate that an employee who acts in such capacity be limited in his work activities to such duty.

There is a conflict in the evidence as to whether the horn was in fact operational within the purview of the standard at the time the C.O. arrived on the scene.

The evidence asserts that an air pressure manual horn was operative when the machine is in operation. However, the parties agree that the alarm was not in operation because the wires were disconnected. There is evidence that the machine was damaged due to vandals when the windshield was also broken. This was verified by the C.O.

The Respondent provided evidence that a signalman was used with the payloader machine. However, the questioning of the

signalman produced contradictory evidence as to whether flags were used (Tr. 147, 149). The Secretary questions the use of the signalman and asserts that we are actually talking about a laborer, who on occasion, acted as a signalman. The facts show that training provided was barely minimal. The Secretary asserts that the signalman was not at the location when the C.O. made his inspection. The witness stated he would always be with the machine even if the backup alarm was working. He also said there was one signalman for each machine. The witness identified the two other signalmen (Tr. 146).

Accordingly, it is apparent that the Respondent has created a sufficient doubt to overcome the allegations that the alternative to a horn was not in use.

The greater weight of the evidence must be found to support the conclusion that while the horn was not fully operational within the purview of the standard, "so as to be distinguishable from the surrounding noise level", at the time the C.O. arrived upon the scene and throughout the short period of time following, the alternate provision of the standard, i.e., that an employee signal that it was safe to use the equipment in reverse gear was complied with.

One additional factor need be mentioned which was noted earlier. Complainant contends that the violation was established because, not only was the signal alarm not distinguishable from the surrounding noise level when operated in reverse,

but there was no employee specifically designated and assigned to signal that it was safe to operate in reverse gear. As appropriate to the context in which used, the word designate is defined as "to indicate; specify."[1/] The standard does not require a special employee to perform only the limited function of signaling.

After considering the evidence and testimony, it is necessary to vacate the alleged repeat violation set forth above.

## FINDINGS OF FACT

The credible evidence and the record as a whole establishes prepondered proof of the following facts:

1. Respondent, Naclerio Contracting Co., Inc., is engaged in interstate commerce and is subject to the provisions of the Act.

2. The evidence of record shows that the Respondent did use an electric saw without a ground fault interrupter or a program.

3. The evidence of record shows that the failure to use the ground fault interrupter or program created a serious hazard to the Respondent's employees that could have resulted in death or serious injury.

---

1/ Webster's New World Dictionary, Second College Edition, World Publishing Co. (1972).

4. The evidence of record shows that the Respondent's payloader did not have a working alarm at the time of inspection.

5. The evidence of record shows that the Respondent provided a signalman in lieu of a signal to warn of the payloaders movements.

6. The evidence shows that the Respondent provided a signalman for each of its payloaders.

7. The evidence shows that the Respondent's equipment was damaged due to vandalism.

8. The evidence shows that the alternative use of a signalman satisfies the requirements of the standard.

## CONCLUSIONS OF LAW

1. Respondent is and was at all times herein, engaged in a business affecting commerce within the meaning of Section 3(5) of the Occupational Safety and Health Act of 1970.

2. The Occupational Safety and Health Review Commission has jurisdiction over the subject matter and parties to this action.

3. The Respondent violated 29 U.S.C. 654(a)(2) by failing to comply with 29 CFR 1926.400(h)(1).

4. The Respondent did not violate 29 CFR 1926.602 (a)(9)(i).

## O R D E R

Upon the basis of the foregoing findings of fact and conclusions of law and upon the entire record, it is hereby

ORDERED that:

Serious Citation number 1 for a violation of 29 CFR 1926.400(h)(1) is affirmed and a penalty of $400.00 is assessed.

Repeat Citation number 2 for an alleged violation of 29 CFR 1926.602(a)(9)(i) is vacated.

JUDGE'S DECISION APR 1 '82

FINAL ORDER ON MAY 3 '82

RECEIVED

ORDER

This case is on remand from the Commission.

Complainant's Motion to Withdraw Citation and Complaint is granted.

Accordingly, Citation No. 1, issued November 11, 1975, the proposed penalty based thereon, and the complaint are DISMISSED with prejudice.

James A. Cronin, Jr.
Judge, OSHRC

Dated: April 1, 1982

## NOTICE OF DECISION

Secretary of Labor v. BATH IRON WORKS CORPORATION
OSHRC Docket No. 80-3358

1. Enclosed is a copy of my decision. It will be filed with the Commission on April 1, 1982, and will become the final order of the Commission on May 3, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is May 3, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

OSHRC FORM 97

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant<br>v.<br>BATH IRON WORKS CORPORATION,<br>Respondent | OSHRC DOCKET NO. 80-3358 |

APPEARANCES:

Ronald Glover, Esq., for Complainant

Mark Haley, Esq., for Respondent

DECISION AND ORDER

This case arose under 29 USC, sec. 651 et seq. of the Occupational Safety and Health Act of 1970 (the Act). As a result of an inspection by the Occupational Safety and Health Administration [OSHA] of the Respondent's premises on or about April 17, 1980, Citation #1 was issued on or about May 15, 1980, charging that the Respondent violated sec. 5(a)(2) of the Act by the serious violation of the standard at 29 CFR 1915.43(c) and/or sec. 5(a)(1) by failing to cover or guard an opening in the deck.

Citation #2 charged the other than serious violation of the standard at 29 CFR 1915.43(e).

On or about June 9, 1980, the Respondent filed Notice of Contest to Citations #1 and #2 and the penalties proposed therefor. At the hearing, the Respondent withdrew its contest of Citation #2...Tr. 2.

The pertinent sections of the Act and the standard are appended to this decision under appropriate titles.

FACTS

The engine room of the ship Corningham (the jobsite) has two working levels, the upper being about 12 feet below the main deck and the lower one being 8 to 9 feet below that. Several months before the inspection in question, as part of an overhaul of the ship, the Respondent had removed some equipment [a fan, air dryer, and duct work] that had been affixed to the deck and bulkhead. As a result, there was an opening [variously estimated at 3-1/2 by 6 feet or 4 by 6 or 5 by 6] flush with the deck and immediately adjacent to the 2 - 3 feet wide passageway through the engine room. Running through that open space, and parallel to the passageway, are two horizontal members [I-beams that had been the foundation for some of the removed equipment] which are about 18 inches apart; and the bulkhead is about 16 inches away from the nearest I-beam. On the day of the inspection, a "sucker hose" [exhaust pipe] extended through the opening down to the lower part of the engine room where work was being done. The opening was partially covered by plywood discs about 24 to 30 inches in diameter and about 1/2 inch thick, leaving an uncovered area variously estimated at 12 to 18 square inches. There are no railings on the passageway, which is the main means of access from the upper level of the engine room to the lower level. A ladderway between the two levels is within 1 foot of the opening. The edge or surface of the horizontal members and the deck are hard or sharp.

[As concerns the different estimates in measurements, this decision is consistent with whatever estimated figures are used, whether minimum or maximum or a combination of both].

On the date in question, some employees were working in the area and others would use the passageway to go from one part of the ship to another. The hazard

was the likelihood of a disc tipping if stepped on, or other misstep directly into the opening, causing an employee to fall into some part of the opening or on the deck, sustaining a possible fracture or other serious injury.

Since the equipment had been removed for many weeks before the inspection, and the passageway was well-travelled, there can be no question that the Respondent knew (or should have known) of the condition.

THE ISSUES

1. Was there any violation?

2. Should the Respondent have protected its employees by the use of guardrails or adequate covering of the opening?

3. Was the nature of work in progress, or the physical conditions, such that the use of guardrails was prohibited?

1915.43(c)

Assuming that some employees were exposed to unguarded edges of a deck more than 5 feet above a solid surface, were the physical conditions such that the use of guardrails was prohibited?

OSHA regulations require that the guardrails would have to be about 42 inches high...Tr. 95, 233, 248. The overhead (ceiling) was about 8 feet high...Tr. 233, 249. The equipment to be installed was approximately 5 feet long and 3 feet square...Tr. 171, 247. Just on the measurements alone, it would seem that the only reasonable conclusion is that it would be practically impossible to install such equipment over 42 inch high guardrails. That conclusion is corroborated by the witnesses who testified on the point.

The Respondent's Chief Safety Engineer [Curtis] testified that, with guardrails or stanchions present, the equipment "could not" have been installed... Tr. 233. In answer to the Judge's question: "You say it would be totally impossible, just not enough room?", Mr. Curtis replied: "Yes, sir."...Tr. 234.

Asked on cross-examination if it was "impossible for them to install this ducting work with the stanchions in place..." Mr. Curtis answered: "That is correct."...Tr. 248.

Mr. Somerville, an apparently neutral witness employed by the U.S. Department of Defense, also testified that the equipment "could not have been installed" with guardrails in place, and it would be "impossible"... Tr. 164, 177.

The other important testimony on the point was from the Compliance Officer, who concluded that he had no opinion "as to whether it would be possible to install...that fan or duct with the guardrails in place"...Tr. 283, 284.

In that state of the evidence -- the testimony of Respondent's employee (Curtis) and a neutral witness (Somerville) both tending to establish impossibility, and the Compliance Officer having no opinion -- I find that the Respondent has established that "the nature of the work in progress or the physical conditions prohibit the use or installation of such guardrails".

Was there "work in progress"? While the evidence was not completely satisfactory, it was established that there was "work in progress" to replace the equipment that had been removed. On that point, the Compliance Officer testified that he did not see any of the equipment in the vicinity of the jobsite; and he recalled no conversations indicating that such work was in progress...Tr. 97-99, 281. However, the Respondent's employees Curtis and Gill both testified that, on the day of the inspection, the Respondent's employees were in the process of bringing ductwork on board or installing it...Tr. 243-247, 276. Although the neutral witness, Somerville, did not see all the equipment, he testified that he did see ductwork in the vicinity... Tr. 158, 186-188.

In view of the positive testimony of Curtis and Gill being at least somewhat corroborated by Somerville, I find that the Respondent's employees were conducting "work in progress" at the time.

Sec. 5(a)(1)

The basic facts testified to by the Compliance Officer were not contradicted: there was an opening in the deck immediately adjacent to the passageway and flush with it. The wooden discs only partially covered it. It could easily have been more adequately and safely covered by planking or plywood fitted to the entire opening. Employees who worked and walked in the vicinity of the hazard could have been seriously injured by it.

The location of the condition, together with the length of time of its existence, establish that the Respondent knew, or should have known, of it.

FINDINGS OF FACT

Having reviewed the testimony and examined the exhibits, the following Findings of Fact are made::

1. At all times concerned, the Respondent regularly received, handled or worked with goods which had moved across state lines.

2. As concerns Citation #1, employees were exposed to the unguarded edges of a deck more than 5 feet above a solid surface but the nature of the work in progress prohibited the use of guardrails.

3. The unguarded edges of the deck in question could have been adequately and safely covered by planking or plywood.

4. The conditions described in Citation #1 exposed the Respondent's employees to sustaining serious harm because of the hazard of falling or tripping in the opening.

5. One or more officers or supervisory personnel of the Respondent knew of the hazardous conditions described herein and knew that employees were exposed to such hazard.

6. The Respondent withdrew its Notice of Contest to Citation #2.

## CONCLUSIONS OF LAW

1. At all times concerned, the Respondent was an employer engaged in a business affecting commerce within the meaning of the Act; and the Occupational Safety and Health Review Commission has jurisdiction over the subject matter and the parties.

2. At all times concerned, the Respondent knew, or with the exercise of due diligence should have known, of the alleged violation.

3. On the date in question, the Respondent was not in compliance with section 5(a)(1) of the Act.

4. The Complainant has not sustained the burden of proving the Respondent violated sec. 5(a)(2) of the Act (sec. 654), as concerns .43(c) but has proven it for .43(e).

## ORDER

The whole record having been considered, and due consideration having been given to 29 U.S.C., sec. 666(j), it is ordered:

1. Citation #1 is affirmed and a penalty of $250 assessed therefor.

2. Citation #2 is affirmed.

SO ORDERED.

FOSTER FURCOLO
JUDGE, OSHRC

Dated: April 1, 1982
Boston, Massachusetts

## APPENDIX

### THE ACT

Section 654 [section 5(a)(1)] Employer "...shall furnish...a place of employment...free from recognized hazards...likely to cause death or serious physical harm to his employees; ..."

Section 654 [section 5(a)(2)] Employer "...shall comply with occupational safety and health standards..."

Section 666 [section 17(b)] "...employer who has received a citation for a serious violation...of this Act...shall be assessed a civil penalty of up to $1,000 for each such violation."

Section 666 [section 17(j)] "...assess all civil penalties...giving due consideration to...the size of the business...gravity of the violation, the good faith of the employer, and the history of previous violations."

Section 666 [section 17(k)] "...a serious violation shall be deemed to exist...if there is a substantial probability that death or serious physical harm could result...unless the employer did not, and could not...know of the presence of the violation."

### THE STANDARD

29 CFR 1915.43(c): When employees are exposed to unguarded edges of decks... more than 5 feet above a solid surface, the edges shall be guarded by adequate guardrails...unless the nature of the work in progress or the physical conditions prohibit the use or installation of such guardrails.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>ARKANSAS RICE GROWERS COOPERATIVE ASSOCIATION,<br><br>Respondent. | OSHRC Docket No. 77-3974 |

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge John S. Patton is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). In his decision, Judge Patton vacated a citation issued after an employee of Respondent was fatally injured when he fell through an opening on the sixth level of Respondent's workplace, a by-products plant in Jonesboro, Arkansas. As amended in the Secretary's complaint, the citation alleged a serious violation of the Act in that the opening was not guarded in compliance with the requirements of 29 C.F.R. § 1910.23(a)(5) or, in the alternative, 29 C.F.R. § 1910.23(a)(3). 1/

---

1/ The standards at issue provide as follows:

Subpart D - Walking-Working Surfaces

§ 1910.23 Guarding floor and wall openings and holes.

(a) Protection for floor openings.

* * *

(3) Every hatchway and chute floor opening shall be guarded by one of the following:

(i) Hinged floor opening cover of standard strength and construction equipped with standard railings or permanently

Throughout this proceeding, Respondent has presented two principal defenses to the citation. First, it contends that the cited standards do not apply to the cited conditions because the sixth level of its workplace is a roof and not a "floor" within the meaning of the cited standards. 2/ Second, it contends that it lacked either actual or constructive knowledge of the violative conditions because it had provided a cover for the opening and it could not have known that an independent contractor would leave the hatchway cover unsecured, thereby assertedly creating the violative condition. Judge Patton rejected Respondent's contention that the standards at issue are inapplicable, but agreed with Respondent that the citation must be vacated because Respondent neither knew nor, with the exercise of reasonable diligence, could have known of the violation. The Secretary petitioned for discretionary review of the judge's conclusion on the

---

(Footnote 1 cont'd)

> attached thereto so as to leave only one exposed side. When the opening is not in use, the cover shall be closed or the exposed side shall be guarded at both top and intermediate positions by removable standard railings.
>
> (ii) A removable railing with toeboard on not more than two sides of the opening and fixed standard railings with toeboards on all other exposed sides. The removable railings shall be kept in place when the opening is not in use and should preferably be hinged or otherwise mounted so as to be conveniently replaceable.
>
> Where operating conditions necessitate the feeding of material into any hatchway or chute opening, protection shall be provided to prevent a person from falling through the opening.
>
> * * *
>
> (5) Every pit and trapdoor floor opening, infrequently used, shall be guarded by a floor opening cover of standard strength and construction which should be hinged in place. While the cover is not in place, the pit or trap opening shall be constantly attended by someone or shall be protected on all exposed sides by removable standard railings.

2/ The key term "floor opening," as used in the standards at issue, is defined as follows:

> § 1910.21 Definitions.
>
> (a) As used in § 1910.23, unless the context requires otherwise,

knowledge issue and Respondent cross-petitioned on his conclusion that the standards apply. Commissioner Cleary directed review on both issues.

We hold that the judge erred in concluding that the cited standards apply to the cited working conditions. In light of this holding, we do not reach the knowledge issue. Accordingly, we affirm the judge's order vacating the citation, but for reasons different than those stated by the judge.

I

Construction was begun on Respondent's by-products plant approximately fourteen months before the incident that led to the citation now before us. Production operations, i.e., the receiving and processing of chicken feed bran and hulls, commenced approximately two months before the incident. At the time of the fatality, both activities were taking place concurrently and, for the most part, independently. Thus, 15 to 20 of Respondent's employees, working under the plant manager and other supervisory personnel employed by Respondent, were engaged in production operations. During this same period, specifically, the two to three weeks immediately before the incident, approximately 35 construction workers employed by 8 to 10 or more construction contractors worked in

---

(Footnote 2 cont'd)

> floor and wall opening, railing and toe board terms shall have the meanings ascribed in this paragraph.
>
> *  *  *
>
> (2) Floor opening. An opening measuring 12 inches or more in its least dimension, in any floor, platform, pavement, or yard through which persons may fall; such as a hatchway, stair or ladder opening, pit, or large manhole. Floor openings occupied by elevators, dumb waiters, conveyors, machinery, or containers are excluded from this subpart.

In addition, the term "platform" is defined, at § 1910.21(a)(4), as follows:

> (4) Platform. A working space for persons, elevated above the surrounding floor or ground; such as a balcony or platform for the operation of machinery and equipment.

the plant on projects such as the installation of wiring, lighting, and a fire control (sprinkler) system.

Respondent's by-products plant consists of six levels. The sixth level is one of four roofs on the plant. Two other roofs are at lower elevations and the fourth is on top of the manlift that is located on the sixth level. Also located on the sixth level are three receiving filters ("cyclones" or "bins") used in the processing of Respondent's product and a hatchway opening used to raise and lower machinery, motors and other heavy objects into and within the building through the vertical shaft directly beneath the opening.

The fatality in question occurred while Respondent's employees were on the sixth level to clean up a large volume of ground rice hulls that had spilled from one of the receiving filters. A member of Respondent's cleanup crew, while carrying a large bag filled with the spilled hulls, stepped on the middle section of the cover that was installed over the hatchway opening on the sixth level. Apparently, that section had been left unbolted by a construction worker who had previously used the hatchway opening to raise or lower materials used in the construction work. As a result, when Respondent's employee stepped on the cover, both he and the middle section fell through the opening. The employee was fatally injured by the fall.

II

As indicated, Respondent has contended throughout this proceeding that the cited standards do not apply to the hatchway opening in question because that opening is located in a roof rather than a floor. In Central City Roofing Co., 76 OSAHRC 61/A2, 4 BNA OSHC 1286, 1976-77 CCH OSHD ¶ 20,761 (No. 8173, 1976), a divided Commission overruled its prior precedent and adopted the holdings of two appellate courts that the guarding of roofs is not required under the construction safety standard at 29 C.F.R. § 1926.500(d)(1). 3/ See Diamond Roofing Co. v. OSHRC,

---

3/ The standard provides:

528 F.2d 645 (5th Cir. 1976), and Langer Roofing & Sheet Metal, Inc. v. Secretary of Labor , 524 F.2d 1337 (7th Cir. 1975). Specifically, the Commission agreed with the Diamond Roofing and Langer Roofing courts that section 1926.500(d)(1) does not apply to open-sided roofs because a roof is not a "floor" within the meaning of that standard.

In the case now before us, Judge Patton rejected Respondent's contention that sections 1910.23(a)(3) and (a)(5) do not apply to roof openings. Though agreeing with Respondent's contention that the holdings of Diamond Roofing, Langer Roofing, and Central City Roofing are applicable to the general industry standards at issue in this case, the judge nevertheless distinguished those cases on the ground that the sixth level of Respondent's facility housed "substantial equipment" used as a permanent part of Respondent's production operation. Because the sixth level provided a surface on which a part of Respondent's processing work was performed, the judge considered it analogous to a floor regardless of the fact that it also served to cover and complete the building structure.

On review, Respondent contends that Judge Patton erred because he misinterpreted the cases decided under Part 1926. In Respondent's view, those cases stand for the proposition that a roof is not a "floor" within the plain meaning

---

(Footnote 3 cont'd)

Subpart M -- Floor and Wall Openings, and Stairways.

§ 1926.500 Guardrails, handrails and covers.

* * *

(d) Guarding of open-sided floors, platforms, and runways.
(1) Every open-sided floor or platform 6 feet or more above adjacent floor or ground level shall be guarded by a standard railing, or the equivalent, as specified in paragraph (f)(1)(i) of this section, on all open sides, except where there is entrance to a ramp, stairway, or fixed ladder. The railing shall be provided with a standard toeboard wherever, beneath the open sides, persons can pass, or there is moving machinery, or there is equipment with which falling materials could create a hazard.

of that term. Because that proposition is equally applicable in interpreting the term "floor opening" as it is used in sections 1910.23(a)(3) and (a)(5), Respondent concludes that the judge erred in distinguishing the instant case from the cases defining the scope of 29 C.F.R. § 1926.500(d)(1).

On review, the Secretary agrees with the judge's conclusion that the sixth level constituted a floor on the facts of this case. The Secretary also reasons that his interpretation of section 1926.500(d)(1) was rejected because it was inconsistent with the roofing industry's practice of not guarding open-sided roofs. In contrast, the Secretary argues that his interpretation of sections 1910.23(a)(3) and (a)(5) in this case "is entirely consistent with the practices embodied in" 29 C.F.R. § 1926.500(b)(1), which expressly requires guarding of roof openings by employers engaged in construction activities. 4/ In support of his analysis, the Secretary cites language in Diamond Roofing, 528 F.2d at 650, to the effect that the customary practice in the roofing industry is to cover or guard roof holes and openings but not to guard the roof perimeter.

In the alternative, the Secretary contends that, if the sixth level is not a "floor," then it is a "platform," as that term is defined at 29 C.F.R. § 1910.21(a)(4). Because the term "floor opening," as defined at 29 C.F.R. § 1910.21(a)(2), includes an opening in a "platform," the Secretary argues that the cited standards apply even if the sixth level was a "platform" rather than a "floor." See note 2 supra.

III

We agree with Respondent's contention that Commission precedent on the scope of 29 C.F.R. § 1926.500(d)(1) is dispositive of the issue before us concerning

---

4/ Section 1926.500(b) is captioned "Guarding of floor openings and floor holes" and it sets forth requirements for such guarding. The definitions that apply to § 1926.500(b) are contained in § 1926.502. Pursuant to those definitions, the terms "floor hole" and "floor opening" as used in § 1926.500(b) refer to specified openings in "any floor, roof, or platform." (emphasis added). Sections 1926.502 (a) & (b). For this reason, § 1926.500(b) requires the guarding of roof openings in the context of Part 1926.

the scope of the standards in 29 C.F.R. § 1910.23(a). In holding that section 1926.500(d)(1) does not apply to open-sided roofs, the court in Diamond Roofing stated that "[a] regulation should be construed to give effect to the natural and plain meaning of its words" and that "a regulation cannot be construed to mean what an agency intended but did not adequately express." 528 F.2d at 649. In addition, the court noted that, where the Secretary intended to include roofs within the coverage of standards imposing requirements for guardrails, he specifically used the term "roof" in those standards. See sections 1926.502(a) & (b), cited at note 4 supra. The Secretary's failure to include the term "roof" in the open-sided floor provision at section 1926.500(d)(1) indicated, in the court's view, an intent to distinguish between a floor and a roof. 528 F.2d at 648.

The Commission majority in Central City Roofing, supra, expressly agreed with the rationale of Diamond Roofing. Moreover, when the Commission reaffirmed this holding in Dun-Par Engineered Form Co., 80 OSAHRC 14/E6, 8 BNA OSHC 1044, 1980 CCH OSHD ¶ 24,238 (No. 16062, 1980), aff'd on other grounds, No. 80-1401 (10th Cir. Apr. 21, 1982), it again stated that it accepted the reasoning of the Diamond Roofing court. 8 BNA OSHC at 1049, 1980 CCH OSHD at p. 29,491. We therefore agree with Respondent's argument that based on applicable Commission precedent a roof is not a "floor" within the plain meaning of that term. 5/

We further conclude that this case cannot be distinguished from Central City Roofing based on the factors relied upon by Judge Patton and by the Secretary. In Dun-Par Engineered Form Co., supra, the Commission rejected the Secretary's contention that it should draw a distinction between roofs on which

---

5/ We note that Subpart D of the general industry standards in which the cited standard is found contains the same distinction between a floor and a roof that the court referred to in Diamond Roofing. See 29 C.F.R. § 1910.22(d)(2) (excessive loads placed "on any floor or roof of a building"). We further note that the Secretary promulgated these standards as an integrated whole notwithstanding the differing source committees within the American National Standards Institute.

professional roofers are performing work, as in Central City Roofing, and roofs on which other types of construction workers are employed, as in Dun-Par. The Commission stated the following:

> The argument that Central City Roofing should apply only when the employees involved are roofers is not persuasive. The Commission in Central City Roofing agreed with the reasoning of the 5th Circuit in Diamond Roofing. The court's decision was based primarily on an interpretation of the language of the standard. The court held, essentially, that the term floor, as used in section 1926.500(d)(1), was not intended to include a roof. To distinguish between roofers and non-roofers would have no effect on this interpretation.

8 BNA OSHC at 1049, 1980 CCH OSHD at p. 29,491. We therefore hold that 29 C.F.R. §§ 1910.23(a)(3) & (a)(5) do not apply to the hatchway opening on the roof of Respondent's workplace. 6/ Because we base this holding on the language of those standards and of the applicable definitions, we conclude, as the Commission did in Dun-Par, that the asserted distinctions relied upon by Judge Patton and by the Secretary are of no legal significance. In particular, we conclude that this case is not distinguishable from the precedent under Part 1926 on the ground that "the roof serves a dual purpose" in this case. In each of the cases under Part 1926, the roofs also served the dual purpose of being both "a covering to protect against the weather and to complete the building" and a walking-working surface for employees. 7/

---

6/ We reject the Secretary's contention that the standards apply because the sixth level at Respondent's workplace was a "platform." Because § 1926.500(d)(1) applies to "[e]very open-sided floor or platform etc.," the cases decided under that standard implicitly hold that a roof is neither a "floor" nor a "platform." We expressly hold in the case now before us that the roof of a building is not a "platform" within the plain meaning of that term.

7/ The Secretary's analogy to § 1926.500(b) is also unpersuasive. The terms "floor hole" and "floor opening" as defined and used in that standard expressly include roof openings. See note 4 supra. In contrast, the definition of "floor opening" as that term is used in the standard at issue in this case, § 1910.23(a), does not include any reference to openings in roofs. See note 2 supra. Therefore, the analogy the Secretary proposes based on customary practice in the industry is contrary to the plain wording of the standards.

For the reasons above stated, we affirm the judge's order vacating the amended citation for noncompliance with 29 C.F.R. § 1910.23(a)(5) or, in the alternative, 29 C.F.R. § 1910.23(a)(3) and further vacating the proposed penalty.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: MAY 6 1982

CLEARY, Commissioner, dissenting:

I respectfully dissent from the majority's decision to vacate the citation on review. Based on a narrow and literalistic interpretation of the term "floor," the majority holds that Respondent is not required to guard an opening on the sixth level of Respondent's workplace even though that opening is 4 feet wide, 9 feet long, and 83 feet 9 inches above the first floor level, to which an employee of Respondent fell to his death. As a result of this holding, workers in general industry, who are usually not accustomed to working around the hazards associated with roofs, will not be provided the same protection against unguarded roof openings that is provided even to the most skilled roofers under 29 C.F.R. § 1926.500(b)(3). 8/

It is undisputed that the sixth level of Respondent's workplace is a roof. Nevertheless, it is also clear from the record that during the time period in question the sixth level was used extensively by several employees as a working and walking surface. For example, the three receiving filters permanently installed on the sixth level were each provided with cage ladders on their sides and platforms on their tops. The purpose of these devices was to enable employees to perform routine and recurring tasks that were an integral and ongoing part of Respondent's production operations, more specifically, the operation of the receiving filters. Thus, employees go onto the platforms to install "bags" or "socks" (long tubes used to collect dust), to check the bags, to change them when necessary, or to "set the pulse rate" of the air flowing through the bags. In addition, members of Respondent's cleanup crew perform maintenance and housekeeping work on the sixth level on a regular and recurring basis. Finally, during the time period in question, an unspecified but apparently large number

---

8/ The standard at § 1926.500(b)(3) is almost identical to the standard that, in my view, applies in the case now before us. See 29 C.F.R. § 1910.23(a)(3), quoted at note 1 of the lead opinion. Although the applicable definitions of "floor opening" as used in the two standards differ, I do not agree with the majority's conclusion that the scope of these two essentially identical standards differs.

of construction workers employed by independent contractors performed various construction tasks on and from the sixth level. Included among their activities was the apparently frequent use of the sixth level hatchway opening to hoist construction materials to and from the sixth level.

Based on this record, Judge Patton concluded that the cited standards apply to the hatchway opening at issue. In rejecting Respondent's contention that the standards are inapplicable because the sixth level of Respondent's workplace is a roof, the judge stated the following:

> If the roof in the case at bar only served the usual purpose of a roof, constituting a covering to protect against the weather and to complete the building, the position of the respondent in this regard would be sound and would be sustained. It will be noted, however, in this case the roof serves a dual purpose. In the case at bar, there was substantial equipment permanently upon the roof, which equipment was a permanent part of the operations of respondent. The roof . . . was a surface upon which a part of the operation of the respondent was to be permanently performed . . . .
>
> Therefore, . . . the particular facts of this case make the roof not only a roof in the usual sense in which the term is used but make it as well a floor, bringing it under the standards relating to a floor.

The judge's findings, including his ultimate finding that the sixth level of Respondent's workplace served a dual purpose, are fully supported by the record. Therefore, I would adopt the judge's conclusion that the sixth level was not only a roof but also a floor, bringing it within the coverage of the cited standards, for the reasons he stated. See Central City Roofing Co., 76 OSAHRC 61/A2, 4 BNA OSHC 1286, 1976-77 CCH OSHD ¶ 20,761 (No. 8173, 1976)(dissenting opinion).

The majority rejects the judge's reasoning and instead accepts and extends the reasoning of the appellate court in Diamond Roofing Co. v. OSHRC, 528 F.2d 645 (5th Cir. 1976). I do not agree with either my colleagues' decision to adopt the Diamond Roofing reasoning or their decision to apply that reasoning in interpreting the standards that are now at issue.

As indicated in the lead opinion, the court's holding in Diamond Roofing is based on two primary lines of reasoning: the plain meaning doctrine (a roof is not a floor within the plain meaning of that term) and the principle of statutory

construction expressio unius est exclusio alterius ("the expression of one thing [here, floors] is the exclusion of another [here, roofs]"). In my view, the Commission should not follow either of these principles in interpreting the standards before us. The term "floor" does not have a single, restricted meaning. In fact, dictionaries contain numerous definitions of the term "floor," including "the surface or the platform of a structure on which to walk, work or travel." Webster's Third New International Dictionary (1971 ed.). I conclude that the sixth level of Respondent's workplace falls squarely within this definition. Therefore, it was a "floor" within the plain meaning of that term. With respect to the principle expressio unius est exclusio alterius, I adhere to my statement in Central City Roofing Co. that the principle is inapplicable in interpreting the term "floor" because a surface can be both a "roof" and a "floor"; "because a roof can be and for . . . [Respondent's employees in this case] is, a walking surface, the terms cannot be considered mutually exclusive." 4 BNA OSHC at 1288, 1976-77 CCH OSHD at p. 24,897. In particular, I do not agree with the majority's implied conclusion that the principle expressio unius est exclusio alterius applies in the context of 29 C.F.R. Part 1910, Subpart D. 9/

---

9/ The majority erroneously relies on the fact that the term "roof" is used in a single subsection of Subpart D, 29 C.F.R. § 1910.22(d)(2). See note 5 of the lead opinion. The standards at issue in this case and the standards in § 1910.22(d) were adopted by the Secretary as "national consensus standards" under § 6(a) of the Act, 29 U.S.C. § 655(a). Yet, the standards contrasted by the majority were derived from two separate and independent sources. See 29 C.F.R. § 1910.31. Section 1910.23, including the standards cited in this case, was derived from ANSI A12.1-1967, Safety Requirements for Floor and Wall Openings, Railings and Toeboards. However, § 1910.22(d) was derived from ANSI A58.1-1955, Minimum Design Loads in Buildings and Other Structures.

In Diamond Roofing, the court reasoned that, because the Secretary had used the terms "roof" and "floor" in one standard but only used the term "floor" in a second standard, the Secretary intended the second standard to apply only to floors and not to roofs. Here, in sharp contrast, neither of the standards being compared by my colleagues were drafted by the Secretary. Instead, they were drafted by two separate ANSI committees acting 12 years apart. Accordingly, there is no basis for concluding that the Secretary intended the term "floor" in § 1910.23(a) to exclude roofs because § 1910.22(d)(2) refers to both floors and roofs.

Although I would adopt Judge Patton's conclusion that the standards in question apply to the cited working conditions, I would reverse his conclusion that Respondent lacked actual or constructive knowledge of the alleged violation. Section 1910.23(a)(3), note 1 of the lead opinion supra, requires employers to guard "[e]very hatchway" by one of two specified means: a "hinged floor opening cover of standard strength and construction equipped with standard railings or permanently attached thereto so as to leave only one exposed side" or "[a] removable railing with toeboard on not more than two sides of the opening and fixed standard railings with toeboards on all other exposed sides." The record clearly establishes that a hatchway opening on the sixth level of Respondent's workplace was not guarded by either of these specified means. While Respondent provided a cover, that cover was not hinged and not equipped with standard railings. 10/ Therefore, I conclude that the Secretary established his alternative allegation that Respondent failed to comply with 29 C.F.R. § 1910.23(a)(3) in that it failed to guard a hatchway in accordance with the specifications of that standard. 11/

---

10/ Respondent argues in effect that it provided equivalent protection by providing a cover that could be bolted into place. On this record I cannot accept that contention. The fatality in question apparently occurred as a result of a construction worker's failure to bolt the middle segment of the cover after using the hatchway. Because the cover was unbolted, it moved when Respondent's employee stepped on it, thereby causing the employee to fall through the opening. However, the fatality could not have occurred if Respondent had provided a hinged cover as required under the standard. The hinges would have kept the cover from moving when the employee stepped on it. Indeed, a cover with guardrails would probably have prevented the employee from repeatedly walking across the cover in the performance of his work.

11/ Respondent argues that it would be denied due process if the Commission considered the issue of whether the cover it provided complied with the standard's requirements. It asserts that this case was tried on the theory that Respondent failed to comply with the standard by failing to assure that the hatchway cover was properly bolted and that the Secretary's contention on review that the opening was improperly guarded comes too late in the proceeding. I disagree. The complaint filed by the Secretary in this case clearly and plainly set forth the allegation that Respondent failed to comply with § 1910.23(a)(3) by failing to provide either of the protective devices specified in the standard. There is no denial of due process in affirming the express allegation of the Secretary's complaint.

I further conclude that Respondent either knew or could, with the exercise of reasonable diligence, have known of the violation because it should have been aware that the cover it provided was neither hinged nor equipped with guardrails. Judge Patton concluded and Respondent argues that Respondent lacked knowledge of the violation because it could not have known that an employee of an independent contractor would leave the hatchway cover unsecured. However, in my view, the cover provided by Respondent failed to comply with the standard regardless of whether it was bolted in place. Therefore, it is irrelevant to the knowledge finding whether Respondent could have known that the cover was unsecured.

For the reasons stated, I would reverse the judge's decision and affirm the Secretary's citation.

## DECISION AND ORDER

APPEARANCES

Robert A. Fitz, Esquire, Office of the Solicitor, U. S. Department of Labor, Dallas, Texas, on behalf of complainant

Oscar E. Davis, Jr., Esquire, Little Rock, Arkansas, on behalf of respondent

## STATEMENT OF THE CASE

PATTON, Judge: This is a proceeding pursuant to section 10 of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651, et seq., 84 Stat. 1590, hereinafter referred to as the Act) contesting a citation issued by the complainant against the respondent under the authority vested in complainant by section 9 of the Act.

The citation alleges that as a result of the inspection of a workplace under the ownership, operation, and control of the respondent located at Jonesboro, Arkansas, the respondent has been charged with violating section 5(a)(2) of the Act by failing to comply with Occupational Safety and Health Standard 29 C.F.R. 1910.23(a)(5) or, in the alternative, standard 29 C.F.R. 1910.23(a)(3).

The hearing was held in Jonesboro, Arkansas, on April 17, 1978. Both parties appeared and presented evidence. There was no motion to intervene. Both parties have submitted briefs.

## LAW AND ISSUES OF THE CASE

It was alleged that an infrequently used trapdoor floor opening on the sixth level of the By-Products Plant of respondent was not guarded by a floor opening cover of sufficient strength and construction, in violation of standard 29 C.F.R. 1910.23(a)(5) or, in the alternative, that a hatchway on the sixth floor of the By-Product Plant was not guarded either by a hinged door opening cover of sufficient strength or construction or by a removable railing on not more than two sides and fixed standard railings on all other exposed sides, in violation of standard 29 C.F.R. 1910.23(a)(3).

Standard 29 C.F.R. 1910.23(a)(3) provides that every hatchway and chute floor opening shall be guarded by either a hinged floor cover of standard strength and construction equipped with standard railings or permanently attached thereto so as to leave only one exposed side or a removable railing with toeboard on not more than two sides of the opening and fixed standard railings with toeboards on all other exposed sides. It is further provided that when the opening is not in use the cover shall be closed, or the exposed side shall be guarded at both top and intermediate positions by removable standard railing.

Standard 29 C.F.R. 1910.23(a)(5) is as follows:

> "Every pit and trapdoor floor opening, infrequently used, shall be guarded by a floor opening cover of standard strength and construction which should be hinged in place. While the cover is not in place, the pit or trap opening shall be constantly attended by someone or shall be protected on all exposed sides by removable standard railings."

It is the contention of the complainant that at a time when the hatchway was not in use the cover was not adequately secure with the result that the cover moved when an employee stepped on it, and the employee went through the hatchway to his death. It is uncontroverted that there were no guardrails up at the time.

The standards are under the subject of "guarding floor and wall openings and holes." The position of the respondent is that the hatchway in question was on a roof, and that the standards apply only to floors; therefore, the standards are not applicable.

It is further the position of the respondent that respondent was not responsible for the hatchway not being secured and had no knowledge it was not secured and, therefore, cannot be held responsible for same.

## EVIDENCE AND EVALUATION OF THE CASE

The respondent permanently maintained several of what were variously called "cyclones" or "filters" in which grain was placed. In the month of October 1977 a problem arose with reference to the filters. Below each filter there is an air lock, and as the material is conveyed in the negative air up to the filter, the material then falls down through the air lock and into a screw conveyor. On October 11, 1977, one of the air locks had been hung and when this happened it started the fans. Mr. Carl Hancock, a by-products machine operator of the respondent was sent up to investigate and start it to running properly again. This was accomplished, but as a result of the malfunction, there had been a substantial spill, with the content spilling not only on the roof at the sixth floor level, but also over to a lower part of the building which was only two stories high (Tr. 38-40). Several employees

constituting a clean-up crew were sent to the sixth level to place the spilled material into hundred-pound bags and to lower the bags over the side to a truck.

A truck was not available on the date of the spillage, so the following Tuesday, being the first date a truck was available, the employees ascended to said level and began to place the spillage in bags and lower them over the side (Tr. 40-41). While engaged in these activities, Mr. James Riley, one of respondent's employees in the clean-up crew, stepped on the hatchway, tipping the opening of the hatchway open, and he went through it to his death.

It is the position of the respondent that the employees were working not on a floor but on a roof, and that under the decisions of the Fifth and Seventh Circuit Courts of Appeals, as well as of the Occupational Safety and Health Review Commission, a standard relating to a floor cannot be considered as also relating to a roof. Admittedly, these decisions have reference to the construction and not the industrial standards. Respondent cites the cases of Diamond Roofing Co., Inc. v. OSHRC, 528 F.2d 645 (5th Cir. 1976), Langer Roofing and Sheet Metal, Inc. v. Secretary of Labor and OSHRC, 524 F.2d 1337 (7th Cir. 1975), and Central City Roofing Co., 76 OSAHRC 61/A2, 4 BNA OSHC 1286, 1976-77 CCH OSHD ¶ 20,761 (No. 8173, 1976).

While the above-cited decisions all relate to construction standards rather than industrial standards, the language of the standards is similar, and it would appear that the reasoning should be the same for an industrial standard as for a construction standard in this regard. Said Circuit Courts

of Appeals, as well as the Review Commission, have held that the terms "floor" and/or "platform" are not broad enough to cover a roof, and that failure of a respondent to conform on a roof to the requirements for a floor or platform cannot be found to be a violation under said standards. If the roof in the case at bar only served the usual purpose of a roof, constituting a covering to protect against the weather and to complete the building, the position of the respondent in this regard would be sound and would be sustained. It will be noted, however, in this case the roof serves a duel purpose. In the case at bar, there was substantial equipment permanently upon the roof, which equipment was a permanent part of the operations of respondent. The roof was not simply a covering to complete the building and to protect against the elements, but it was a surface upon which a part of the operation of the respondent was to be permanently performed. The fact that the top area upon which work was to be performed and which was an integral part of the processing of the work done by the respondent is uncovered does not make it any the less a floor.

Therefore, while the position of the respondent that the cases above cited should be applied equally to the industrial standards is sound, the particular facts of this case make the roof not only a roof in the usual sense in which the term is used but make it as well a floor, bringing it under the standards relating to a floor.

It therefore must be determined whether the respondent has violated either of the above-cited standards.

Mr. Gilmore who was supervisor over the clean-up crew, as well as over others, went to the sixth level to look at the spill before the crew

went up to clean it (Tr. 44). However, he went to cyclone number two and did not go into the area of the hatch (Tr. 44). He was not at the sixth level while the crew was working at that level (Tr. 44). The passageway was normally bolted, and with the bolts in place, the hatchway was secure (Tr. 57). At the time of the accident, a cable was extending down under the hatchway, and the cable could not have gone under the hatchway cover if it had been properly bolted in place (Tr. 57). Three weeks before the accident, Mr. Gilmore inspected the hatchway, and it was screwed in place properly (Tr. 74). Mr. Gilmore had no knowledge of the cable hanging through the hatchway at the time of the accident (Tr. 75). He stated that they had only been working in the building approximately two months. There was a time during construction when no covers were over the hatchway. Mr. Gilmore was not certain how it was protected but thought it was with guardrails at that time (Tr. 80). Subsequent to the accident, a three-inch bar was placed all the way across the roof and fastened to the hatchway, and it was locked with a padlock. Guardrails were established and the bolts were taken out and bored holes went into the other lid so the bolts had to go all the way through both lids (Tr. 80). "Keep off" signs were also erected subsequent to the accident. Employees testified that they went to the area about twice a week to clean it up and sweep the floor off and shovel the material into a bag (Tr. 89).

Ms. Debra Florene Kennedy testified that approximately a week before the accident she was at said level, and two ends of the hatchway cover were bolted down, but the middle part had been raised by construction men bringing material to the roof. She said the middle part slid over a bit while

they were cleaning (Tr. 89). Construction men who were still working on the building were using a winch at the sixth level at the time that said employee was up there (Tr. 91). She has never seen respondent's employees using the winch (Tr. 91). She was "pretty sure" the construction men were through working for the day at the time she was there (Tr. 93). They were, however, still at the building (Tr. 93). She did not know what the situation was in this regard on the day before the spill (Tr. 93). She had no knowledge of the condition of the hatchway between the date she was at the top a week prior to the accident and the date of the accident (Tr. 94). She had never seen the employees of the respondent use the hatchway in any way (Tr. 94).

Mr. Gilmore and the plant manager had 20 or 30 employees to supervise, and there was no way they could deal with all employees in each job they were doing (Tr. 94-95). The employees were instructed to report any unsafe condition they might find (Tr. 95).

Mr. Mark Allen Fox, an employee in the clean-up crew, testified that on the day of the accident the crew was loading the bags and pulling them from one corner of the roof to the other corner and then lowering them over the side (Tr. 100). Mr. James Riley was working with Mr. Fox. They would move the bags across the hatchway cover. Mr. Fox did not notice anything wrong with the hatchway and did not see the cable hanging down (Tr. 100-101). He stated that he did not see any of the supervisors on the roof (Tr. 101).

The truck was located where it was because there was no place they could lower the bags other than the area in which they were lowered

(Tr. 102). There were ladders and other objects on the other side preventing them from lowering the bags in that area (Tr. 102). There were about 30 to 35 bags on the sixth level and also some on other levels (Tr. 103). Nearly all the bags were full, and they weighed about 100 pounds. At first, the employees took them over one at a time and then lowered them, but after they were about half through, they took them across and piled them up before lowering them (Tr. 104). Mr. Riley carried a couple of bags over and lowered them over the side (Tr. 105). It was necessary to cross the hatchway to get from one point to the other. Mr. Fox walked across the hatchway more than five times, and there was no give or tilt (Tr. 105, 107).

A cable was hanging down that loosely fit under the edge of the center hatch. The hatch did not have a real big bolt in it. The cable went under the hatch cover just a bit off center. He did see the cable hanging under it. It did not indicate to him any danger, because he had already walked on the hatch, and it seemed secure (Tr. 107, 108). He did not look to see if the bolts were in place (Tr. 108). He had been instructed that if he saw anything unsafe to report it to his supervisor immediately, but he did not recognize the situation as a problem (Tr. 108). He had been on the roof approximately 15 to 30 minutes when the accident occurred (Tr. 109). He did not look Friday or Saturday to see if the cable was under the lip of the cover; he was only at that time concerned about the spill (Tr. 109). He was not on the roof on Monday (Tr. 110).

He stated he has seen contractors use the hatchway (Tr. 110). The construction men were in and out during the preceding days (Tr. 110). Construction men were in the building on a daily basis and came and went

without in any way contacting anyone related to the respondent. He had never seen the respondent's employees use the shaftway on the roof. He had seen them use it at a lower level, using it to lower a ladder or pull an air hose up (Tr. 111). On the other floors there were no hatchway covers, but there were railings (Tr. 111). It was not unusual that there was no supervisor at said level. (Tr. 112). The employees are just supposed to clean up without being instructed (Tr. 112). Spills happen with great frequency, although they never had, so far as he knows, a previous spill on the roof (Tr. 112-113). He told Mr. Riley the cable was in his way (Tr. 113-114).

At the time of the accident, Mr. Fox had part of one foot resting on the hatchway, and there was about a foot between the hatchway and the railing (Tr. 114). The lid moved, he turned around, and Mr. Riley was already down by the fifth floor (Tr. 115). Mr. Fox did not feel any movement of the hatchway at any other time (Tr. 115).

Mr. Jerry Loux, compliance officer, testified that Mr. Gilmore was aware that the cable was suspended through the hatchway (Tr. 140). Mr. Loux admitted, however, that he had testified in his deposition that Mr. Gilmore did not tell him one way or the other whether or not the cable came from the roof, and that Mr. Gilmore specifically disclaimed knowledge as to whether the cable was coming from the roof. The deposition was introduced in evidence for impeachment purposes. In view of the statements made in the deposition, Mr. Loux must have been in error in his initial statement, and therefore his statement as to an admission by Mr. Gilmore cannot be credited. Mr. Loux stated he did not see any other contractors out there at the time he was there (Tr. 154).

Counsel for the complainant stated that respondent did not know who created the condition, when it was created, or how long it existed, but counsel had concluded that with the exercise of reasonable diligence, the respondent should have known of the condition.

The evidence is to the effect that the respondent had a very complete safety program. The respondent's rules provided for disciplinary action to be taken in case safety rules were violated, and employees had positive instructions to report any unsafe conditions immediately. The hatch was supposed to be bolted down, and none of the supervisors of respondent had any knowledge that it was not bolted down at the time of the unfortunate accident. The evidence is to the effect that employees of respondent did not use the hatchway, although at times the construction workers did. What apparently happened is that a construction worker failed to bolt the hatchway down after completing the work. The evidence is to the effect that this had happened on at least one other occasion; however, there is no indication that it was in any way brought to the attention of supervisors of the respondent. It therefore appears probable that the unsafe condition was created by a person working for another employer, and the respondent had no reason to anticipate that this would have happened. Immediately after the accident, the respondent took substantial precautions, such as erection of guardrails, locking the hatch down, putting up signs forbidding anyone stepping on the hatch, etc. Of course, it would have been better if all of these steps had been taken prior to the date of the accident. There is no reason, however, that the respondent would not have believed that bolting the hatchway down was adequate protection against the hatchway

slipping and creating a hazardous condition. It must therefore be held that the complainant has not established a violation.

## FINDINGS OF FACT

1. Respondent is an Arkansas corporation operating a grain elevator in Jonesboro, Arkansas.

2. On October 11, 1977, the respondent maintained filters for grain on top of the building in which it operated.

3. A hatchway was maintained on top of the building, which hatchway was kept bolted down.

4. The employees of respondent did not use that hatchway, but construction workers did.

5. On October 11, 1977, there was a defect in the filters which caused a spillage of grain which had to be cleaned up by respondent's employees.

6. Respondent sent several employees to the top of the building for the purpose of placing the grain in bags and lowering the bags over the side of the building.

7. The hatchway was not bolted at the time the employees began said clean-up operation.

8. The rules of respondent required that the hatchway be bolted.

9. The supervisors of the respondent did not have knowledge of the fact that the hatchway was not bolted.

10. One of respondent's employees, Mr. Riley, while dragging bags from one side of the top of the building to the other, stepped on the hatchway which tilted, causing Mr. Riley to fall to his death.

11. The respondent had a substantial safety program and instructed its employees to immediately report any unsafe conditions.

12. Respondent took reasonable precautions to avoid an accident such as occurred.

13. Since the respondent had permanent machinery which was a part of its permanent operation on top of the building, said area was not only a roof, but was also a floor as said terms are defined in the standards.

## CONCLUSIONS OF LAW

1. Respondent was engaged in a business affecting interstate commerce and was within the jurisdiction of the Occupational Safety and Health Act.

2. Since the area involved in this case was a floor surface, as well as a roof, standards 29 C.F.R. 1910.23(a)(3) and 29 C.F.R. 1910.23(a)(5) apply to the area involved in this case.

3. Respondent did not violate standards 29 C.F.R. 1910.23(a)(3) or 29 C.F.R. 1910.23(a)(5).

## ORDER

It is therefore ORDERED that:

Respondent is not in violation of standard 29 C.F.R. 1910.23(a)(3).

Respondent is not in violation of standard 29 C.F.R. 1910.23(a)(5).

The allegations of violation of said standards are dismissed.

Dated this 13th day of September 1978.

## ORDER DISMISSING
## PETITION FOR FEES AND EXPENSES

SPARKS, Judge: After a final decision in which "serious" citation number one was vacated and "other" citation number two was affirmed, petitioner filed a petition for attorney fees and expenses contending it was entitled to such monies pursuant to provisions of the Equal Access to Justice Act (EAJA), 5 U.S.C.A. § 504. The pertinent portion of the Act states as follows:

> "An agency that conducts an adversary adjudication shall award, to a prevailing party other than the United States, fees and other expenses incurred by that party in connection with that proceeding unless the adjudicative officer of the agency finds that the position of the agency as a party to the proceeding was substantially justified or that special circumstances make an award unjust."

Petitioner states it is an eligible party to receive an award as a result of a proceeding before the Review Commission which resulted in a final order on November 25, 1981. Petitioner further contends it was the prevailing party in the adversary adjudication and that the position of the Occupational Safety and Health Administration alleging a violation of 29 C.F.R. § 1910.217(c)(2)(i)(a) was not substantially justified.

The Secretary of Labor opposes any award of fees and expenses and asserts that, if petitioner is entitled to any money, it is limited. Specifically, the Secretary contends the petitioner is not entitled to fees or expenses incurred prior to the effective date of the Act, October 1, 1981, or for expenses for postage, parking, van rental, hearing transcript or other expenses outside the ambit of section 504(b)(1)(A). The Secretary points out that the petitioner did not prevail on all issues because citation number two was affirmed without modification. In addition, the petition is alleged to lack sufficient documentation concerning the eligibility of the petitioner and the expenses claimed. Finally, the Secretary alleges his position in this case was substantially justified.

The Review Commission has published rules implementing the EAJA at 29 C.F.R. § 2204, which require written findings and conclusions concerning significant issues in the proceeding, § 2204.308.

The rules were published pursuant to 5 U.S.C.A. § 504(c)(1) which requires that each agency ". . . establish uniform procedures for the submission and consideration of application for an award of fees and other expenses."

The petition alleges the conclusions specified in the EAJA but does not, in several instances, provide the specific factual information required by Commission Rules at § 2204. The petition alleges petitioner is a "party" as defined in 5 U.S.C.A. § 504(b)(1)(B) but does not specify the conditions which qualify it as a party.

In view of the disposition of this matter, it is assumed without deciding that the petitioner is a "party". Neither is it necessary to decide whether a claim may be made for expenses incurred prior to October 1, 1981, or the proper amount of fees and expenses which may be recovered.

The undersigned administrative law judge, acting as the adjudicative officer, concludes the position of the agency was substantially justified and, accordingly, the petition for fees and expenses must be dismissed. Rules of the Commission (§ 2204.106) provide that the burden of proof that an award should not be made to an eligible prevailing application is on the Secretary.

As stated in the brief for the Secretary:

> "The House Report on the EAJA provides significant guidance in deciding whether the position of the Secretary in this case was substantially justified:
>
> > The test of whether or not a Government action is substantially justified is essentially one of reasonableness. Where the Government can show that its case had a reasonable basis both in law and fact no award will be made . . . The standard . . . should not be read to raise a presumption that the Government position was not substantially justified simply because it lost the case. Nor in fact, does the standard require the Government to establish that its decision to litigate was based on a substantial probability of prevailing.
>
> "H.R. Rep. No. 96-1418, 96th Cong., 2d Sess. 10-11 (1980) reprinted in 1980 U. S. Code Cong. and Admin. News 4990."

The evidence established the physical conditions alleged in citation number one for which there was legal precedence that a violation of the regulations had been shown. The contentions of the Secretary were reasonable and supportable both in law and in fact. The allegations were made in good faith and after deliberate consideration. That disputes in the evidence and interpretations of law were resolved against the Secretary does not indicate his position lacked justification, nor does the Secretary's failure to appeal the decision show that his position was without merit. The facts and law in this case were such that reasonable people could disagree. Under such circumstances, the positions of the Secretary were substantially justified.

## FINDINGS OF FACT

1. B. A. B. Metal Fabricators, Inc., operates a shop at 4832 Ridge Road, Cleveland, Ohio, where it cuts and forms metal to the specifications of its customers.

2. Following an inspection of its facility, petitioner, on December 5, 1980, was issued two citations alleging violations of the Occupational Safety and Health Act of 1970 by official representatives of the Occupational Safety and Health Administration.

3. Citation number one alleged a serious violation of 29 C.F.R. § 1910.217(c)(2)(i)(a) in that point of operation guards on mechanical power presses did not prevent entry of hands or fingers into the point of operation by reaching through, over, under, or around the guards of the Cleveland press and the Federal press. A penalty of $200 was proposed.

4. Citation number two alleged an other than serious violation of 29 C.F.R. § 1910.219(f)(1) in that gears of a Cincinnati drill were not guarded by a complete enclosure as required by specific regulations. No penalty was proposed.

5. Following a notice of contest, a hearing on the merits was held at Cleveland, Ohio, on July 10, 1981.

6. At the hearing, the Secretary offered credible and probative testimony by Compliance Officers Andersen and Dill that they could reach their hands under the guards of the Cleveland and Federal presses (Tr. 16-17, 22, 24, 28, 37-39, 59-57A). At the time the tests were performed, material was not in the machines.

7. Mr. Joseph Leachko, the principal operator of the presses, testified it was difficult to reach around the guards into the die area and to do so would require a person to move his hand into a "Z" shape to reach the point of operation.

If material were in the press or if the guards were set at one-eighth or one-fourth inches, it would be impossible to get the fingers into the die areas (Tr. 82-85). His testimony was believable, although somewhat confusing concerning whether the conditions he testified about existed prior to changes in the guards made after the inspection.

8. Based upon the disputed, conflicting and reconcilable testimony, the following findings of fact were made:

> "7. On or about November 25, 1980, an inspection was conducted by Compliance Officer Joanne Andersen. As part of her routine inspection, Ms. Andersen was able to push her hand under and past the guards and reach the points of operation with her fingers.
>
> "8. Although it was possible for a person's fingers to reach under the guards and into the points of operation, because of the location and height of the hazardous area considerable effort and manipulation of the hands and fingers was necessary to do so.
>
> "9. Deliberate and intentional action was necessary for a person's fingers to reach the hazardous zone.
>
> "10. There was no legitimate operation reason for a person to place his fingers within the hazardous zone and no evidence that any employee had ever done so.
>
> "11. The Cleveland and Federal Presses did not expose employees to a cognizable hazard."

9. Pursuant to the findings set forth in paragraph eight above, a conclusion of law was entered that respondent had not violated the regulation as charged in the citation.

10. The evidence clearly established that employees were exposed to gears of the Cincinnati drill as alleged in citation number two.

11. Citation number one was vacated and citation number two was affirmed.

12. The evidence presented by the Government was reasonable, relevant and probative to establish its contentions regarding citation number one.

13. The legal arguments of the Secretary that the failure to comply with the terms of a regulation is sufficient to establish a violative hazard are reasonable, legally defensible, and supported by some precedent.

14. Although relevant to the issues, the Secretary's failure to appeal the decision does not establish that his position was without merit.

15. The positions of the Secretary were reasonable in fact and law.

## CONCLUSIONS OF LAW

1. The petitioner was a prevailing party in a significant and discrete substantive portion of the proceeding within the meaning of § 2204.106.

2. The positions of the Secretary were substantially justified in the adversary adjudication in this matter.

## ORDER

The petition for fees and expenses is dismissed.

Dated this 6th day of April, 1982.

## DECISION AND ORDER

Ditore, J.

## PRELIMINARY STATEMENT

Respondent seeks relief from an order affirming the proposed penalties which became final due to Respondent's late filing of its Notice of Contest to the proposed penalties. If relief is granted from the final order pursuant to Rule 60(b)(1) and (6) of the Federal Rules of Civil Procedure, Respondent contests all the proposed penalties as unreasonable.

A. Late Filing of Notice of Contest to Proposed Penalties

Respondent is in the business of manufacturing concrete and is located at 1225 Church Street, Bohemia, New York. The concrete plant is about five acres in size and employs twenty-five employees. Robert Collins is vice-president of the company and takes care of all of Respondent's business (T. 6, 7, 8).

On May 28, 1981, Respondent's workplace was inspected by Joseph Ornellas, a compliance officer for the Occupational Safety and Health Administration (T. 16, 18). As a result of the inspection, Respondent was issued on June 15, 1981, a citation for sixteen serious violations with a total proposed penalty of $1,850.00, and a citation for twenty-one nonserious violations with a proposed penalty of $50.00 for item 14A of the citation (citations).

Respondent admits it received the citations on June 18, 1981 (T. 6, Exh. C-1). Respondent's time to contest the citations and penalties ended on or about July 10, 1981. Respondent filed a late notice of contest on July 21, 1981, which contested only the proposed penalties (T. 9, item 3 of file).

Robert Collins, Respondent's vice-president, testified that upon receipt of the citations he immediately started to, and has, corrected each of the violations in the two citations; and that he intended on behalf of Respondent, to contest the proposed penalties as unreasonable.

He received the citations at the busiest time of his business year. During this time he worked 15-16 hours a day, six days a week running the plant, setting up new systems, updating some equipment, doing most of the sales and all of the bidding. (T. 6, 8). This heavy workload caused him to lose track of time and overlook the date when he was required to file the notice of contest. He filed the notice of contest a week or so late (T. 6, 8, 9).

The unrebutted testimony of Mr. Collins that he immediately started to and did abate all the violations; that he was under a heavy workload pressure of a 15-16 hour work day, six days a week; and that he was the only officer of the company that handled the day-to-day business of Respondent, gives rise to a finding of excusable neglect on the part of Mr. Collins in filing Respondent's late notice of contest to the proposed penalties. Respondent is granted relief under Rule 60(b)(1) of the Federal Rules of Civil Procedure from the final order affirming the penalties. See, Secretary v. Branciforte Builders, Inc., 9 BNA OSHC 2113, 1981 CCH OSHD ¶25,591 (No. 89-1920, 1981); cf, Secretary v. P & A Construction Co., Inc., 10 BNA OSHC 1185, 1982 CCH OSHD ¶25,783 (No. 80-3848, 1981).

B. Statement of the Evidence as to the Proposed Penalties

Officer Ornellas testified that he made the following observations at Respondent's worksite on May 28, 1981.

Serious Citation

Item 1 - 29 CFR § 1910.23(b)(1)(i)

Officer Ornellas observed an employee working in the hopper building some 14-1/2 feet above ground. A wall opening in the room where the hopper was located was unguarded except for a piece of wood 2 feet high which leaned against the opening. One employee spent about 4 hours a day in this room and in walking between the hopper and wall opening, came within 3 feet of the unguarded opening. The employee was exposed to a fall of 14-1/2 feet (T. 16, 18-23, see also 64-65; Exhs. C-2, C-3). Ornellas proposed a penalty of $350.00, after allowing credits of 20 percent for size, 20 percent for good faith and 10 percent for history (T. 23). This credit allowance applies to all the penalties proposed herein.

Item 2 - 29 CFR § 1910.23(c)(2)

Officer Ornellas observed some railing missing on the upper part of the hopper building. He observed no employee exposed but was told by a foreman that employees go up to that area from time to time to check on various conditions once a week. He believed that an employee in the area of the missing railing was exposed to a 30-foot fall to the ground. After allowing deductions or credits, he proposed a penalty

of $350.00 for this violation (T. 25, 28, 29, 30, 31; Exhs. C-4, C-5). Mr. Collins, Respondent's vice-president, stated that one employee was in this area possibly once a week to grease a belt or to check (T. 65).

Item 3A - 29 CFR § 1910.157(c)(1)
Item 3B - 29 CFR § 1910.106(e)(2)(iv)(a)
Item 3C - 29 CFR § 1910.252(d)(2)(ii)

Officer Ornellas observed that Respondent did not provide portable fire extinguishers in the compressor boiler building and in the maintenance building (item 3A) and did not provide suitable fire extinguishers in the welding area of the maintenance building (item 3C). He further observed that a five gallon container of lubricating oil was uncovered in the maintenance building (item 3B). He believed these three violations exposed some twenty employees working in the area to burn and smoke inhalation hazards in case of a fire. He proposed after allowing credits, a penalty of $200.00 for the three violations (T. 32-37). Mr. Collins, Respondent's vice-president, stated the lubricating oil was oil taken from a vehicle (T. 65).

Item 4A - 29 CFR § 1910.215(a)(2)
Item 4B - 29 CFR § 1910.215(a)(4)

These two violations pertain to one Milwaukee floor pedestal off-hand grinder. Officer Ornellas observed that

the abrasive wheel of the grinder was unguarded and the machine did not have a work rest. He believed that these two violations exposed an employee to the hazards of flying chips if the abrasive wheel shattered. He stated that two employees used the machines, a few minutes at a time, for about 5 to 10 minutes a day. He proposed a penalty of $150.00 after allowing credits for the two violations (T. 37-41, See also T. 65; Exh. C-6).

Item 5A - 29 CFR § 1910.219(d)(1)
Item 5B - 29 CFR § 1910.219(e)(1)(i)
Item 5C - 29 CFR § 1910.219(e)(1)(i)
Item 5D - 29 CFR § 1926.300(b)(2)

These four items relate to lack of guards on pulleys and belts of five different machines. Officer Ornellas observed that the pulleys and belts of a hopper (item 5A(A) and 5B(A), the pulleys and belts of an abrasive cut-off saw (items 5A(B) and 5B(B), the pulleys and belts of a compressor (items 5A(D) and 5B(C), the pulleys and belts of a pedestal drill press (items 5A(C) and 5(C), and the drive pulley of a rebar bender (item 5D) were unguarded (T. 41, 42). Officer Ornellas observed eight employees walk within 2 to 3 feet of the unguarded belts and pulleys located on the lower part of the hopper (T. 42, 43). He observed one employee operating the abrasive cut-off saw, within 12 to 15 inches from the machine's belt. The machine is used about 3 hours daily by one employee (T. 43, 44, 45). He observed that the drill

press had no guard on the rear pulley which was up against a wall. The machine was not in operation at the time of the inspection but officer Ornellas believed that an employee could be exposed to the unguarded rear belt and pulley when walking by the side of the drill press (T. 44). He further observed an air compressor which went on and off automatically, that had an unguarded belt and pulley at the rear of the compressor which was up against a wall (T. 45). He observed one employee enter the compressor area and remain one hour in the room. Ornellas believed that if an employee walked within 2 feet of the side of the compressor and fell, the employee could get his hands in the nip point area (T. 45, 46). He also observed a rebar bender which lacked a guard on its drive pulley (T. 50). He believed that the unguarded pulleys and belts exposed employees who walked by the machines or used the machines, to nip point hazards, i.e., bone fractures or amputations (T. 42). He proposed an adjusted penalty of $250.00 for the collective pulley and belt violations.

Mr. Collins, Respondent's vice-president, stated that the hopper was approachable from one direction only and the closest an employee could come to the belt and pulley area was 5 to 8 feet. The machine was not in a normal work area (T. 65). The abrasive cut-off saw was not used for more

than one hour a day and not on a daily basis (T. 65-66). The drill press was protected on two sides. The rear was against a wall and one side by other equipment. The front of the machine was the only area where an employee could be exposed and this area was guarded (T. 66). The compressor was located in a corner of a wall and was not in a normal work area (T. 66). The rebar bending machine is used by 3 to 4 employees for 2 to 3 hours a day (T. 67).

Item 6A - 29 CFR § 1910.252(a)(2)(iv)(c)
Item 6B - 29 CFR § 1910.101(b)
Item 6C - 29 CFR § 1910.252(a)(2)(ii)(b)
Item 6D - 29 CFR § 1910.252(a)(2)(ii)d)

Officer Ornellas observed in the maintenance building two oxygen and one acetylene cylinders which were improperly stored together, and were not secured (items 6A, 6C). In addition the two oxygen cylinders lacked valve protection caps (item 6D). He further observed in another area of the maintenance building oxygen and acetylene cylinders which were not properly supported (item 6B). He believed that the two oxygen cylinders and one acetylene cylinder in items 6A, C and D, exposed two employees working 20 or 30 feet away, to hazards of gas leakage if the improperly stored, uncapped and unsecured cylinders were to fall and rupture. The same hazard existed for two employees working some 6 feet from the cylinders cited in item 6B (T. 52, 53, 54, 55, 56-58). He proposed an adjusted penalty of $250.00 for the four violations.

Mr. Collins, Respondent's vice-president, stated the cylinders referred to in items 6A, 6C and 6D were empty and stored against a wall, some 20 to 30 feet from where an employee normally worked (T. 67).

Item 7 - 29 CFR § 1926.602(a)(9)(ii)

Officer Ornellas observed a payloader machine operating in the yard area which had no back-up or reverse signal alarm. Seven employees were 5 to 10 feet from the payloader while it was operating (T. 58-60). He proposed an adjusted penalty of $300.00 for this violation.

Mr. Collins stated this vehicle is used about 2 hours a day. At the time of the inspection, the back-up signal was not working. A new part was on order (T. 67).

Nonserious Citation

Item 14A - 29 CFR § 1910.304(f)(5)(v)(e)(1)

Officer Ornellas observed a water cooler in the maintenance building whose electric plug was not properly grounded, exposing those employees who used the water cooler to a possible electric shock hazard. He proposed an adjusted penalty of $50.00 for this violation (T. 61-64).

## OPINION

The specific findings of fact are set forth herein as they apply to the contested penalties.

### Serious Citation

#### Item 1

Respondent was in violation of 29 CFR § 1910.23(b)(1)(i) for failing to guard a wall opening in a room of the hopper building. The opening was 14-1/2 feet above ground. One employee spent four hours a day in this room and was exposed to the improperly guarded wall opening when, and if, he walked between the hopper and the wall opening which placed him within three feet of the wall opening. Based on the above facts and on a consideration of the statutory factors of section 17(j) of the Act, the proposed penalty of $350.00, is unreasonable and is reduced to $250.00.

#### Item 2

Respondent was in violation of 29 CFR § 1910.23(c)(2) for failing to replace some railing on the upper part of the hopper building. The area of the missing railing was 30 feet above ground. Only one employee would be in this area possibly once a week to check or to grease a belt.

Based on the above facts and on a consideration of the statutory factors of section 17(j) of the Act, the proposed penalty of $350.00 is unreasonable and is reduced to $200.00.

Items 3A, 3B, 3C

Respondent was in violation of 29 CFR §§ 1910.157(c)(1), 1910.106(e)(2)(iv)(a) and 1910.252(d)(2)(ii) for failing to provide portable fire extinguishers in the compressor area and maintenance building (item 3A) and in the welding area of the maintenance building (item 3C), and for failing to cover a five-gallon container of lubricating oil that was taken from a vehicle (item 3B). Other than the welding area, and the five-gallon can of vehicle lubricating oil, there is no evidence to indicate the nature and quantity of any combustible material in the compressor room or maintenance building. Based on the facts and on a consideration of the statutory factors of section 17(j) of the Act, the proposed penalty of $200.00 is unreasonable and is reduced to $100.00.

Items 4A, 4B

Respondent violated 29 CFR §§ 1910.215(a)(2) and 1910.215 (a)(4) by failing to guard the abrasive wheel of, and to provide a work rest for, an off-hand grinder. This machine is used by two employees for a few minutes at a time, for a total of about 5 to 10 minutes a day. Based on the infrequent use

of the machine and on a consideration of the statutory factors of section 17(j) of the Act, the proposed penalty of $150.00 is unreasonable and is reduced to $50.00.

Items 5A, 5B, 5C and 5D

Respondent violated 29 CFR §§ 1910.219(d)(1), 1910.219 (e)(1)(i) and 1926.300(b)(2) by failing to guard the pulleys and belts of a hopper, an abrasive cut-off saw, a compressor, a drill press and a rebar bender. The belt and pulley area located on the lower part of the hopper was approachable from one direction only and the closest an employee could come to this area was 5 to 8 feet. The abrasive cut-off saw was not used for more than one hour a day and not on a daily basis. The rear of the drill press where the cited unguarded belt and pulley were located, was against a wall. The front of the machine was the only area where an employee could be exposed and this area was guarded. The compressor's unguarded belt and pulley were at the rear of the machine which was located in a corner of a wall and not in a normal work area. The rebar bender was used by 3 or 4 employees for 2 to 3 hours a day.

The location of the machines, their infrequent use, and and the misapplication of 29 CFR § 1926.300(b)(2) (item 5D), a construction standard, to Respondent's workplace, considered with the statutory factors of section 17(j) of the Act, renders

the proposed penalty of $250.00 unreasonable. The penalty is reduced to $100.00.

Items 6A, 6B, 6C, 6D

Respondent violated 29 CFR §§ 1910.252(a)(2)(iv)(c), 1910.101(b), 1910.252(a)(2)(ii)(b) and 1910.252(a)(2)(ii)(d) for failing to secure, properly store and cap two oxygen and one acteylene cylinders which were located in the maintenance building (items 6A, 6C, 6D), and for failing to properly support oxygen and acetylene cylinders in another area of the maintenance building (item 6B). The two oxygen cylinders and one acetylene cylinder cited in items 6A, 6C and 6D, were empty and stored against a wall some 20 to 30 feet from where an employee normally works.

Based on the above facts and on a consideration of the statutory factors of section 17(j) of the Act, the proposed penalty of $250.00 is unreasonable and is reduced to $100.00.

Item 7

Respondent violated 29 CFR § 1926.602(a)(9)(ii) for failing to have an operating back-up or reverse signal alarm on its payloader machine. The machine was in operation about 2 hours a day, and a new back-up signal was on order. It is questionable whether the construction standard cited applies to Respondent's workplace.

Based on the above facts and on a consideration of the statutory factors of section 17(j) of the Act, the $300.00 proposed penalty is unreasonable and is reduced to $50.00.

Nonserious Citation

Item 14A

Respondent violated 29 CFR § 1910.304(f)(5)(v)(e)(1) for failing to properly ground a water cooler. The proposed penalty of $50.00 for this violation is reasonable.

The total proposed penalty of $1,900.00 is reduced to $900.00.

CONCLUSIONS OF LAW

1. Respondent is, and at all times material herein was, engaged in a business affecting commerce within the meaning of section 3(5) of the Act (29 U.S.C. § 652(5)).

2. The Occupational Safety and Health Review Commission has jurisdiction over the subject matter and parties to this action.

3. Pursuant to Rule 60(B)(1) of the Federal Rules of Civil Procedure, Respondent is granted relief from the final order affirming the original proposed penalties.

4. Under the circumstances of this case with due consideration of the statutory factors of section 17(j) of the

Act, the proposed penalties for the serious violations and one nonserious violation, are reduced as specified in the Opinion supra, pp.10-14. The total proposed penalty is reduced from $1,900.00 to $900.00.

ORDER

Due deliberation having been had on the whole record, it is hereby

ORDERED that Respondent is relieved from the final order affirming the penalties as originally proposed, it is further

ORDERED that the penalties proposed for the serious violations in citation No. 1 are reduced as follows: item 1 to $250.00, item 2 to $200.00, items 3A, 3B and 3C to $100.00, items 4A and 4B to $50.00, items 5A, 5B, 5C and 5D to $100.00, items 6A, 6B, 6C and 6D to $100.00 and item 7 to $50.00, and as reduced, are affirmed, it is further

ORDERED that the penalty of $50.00 for item 14A of the nonserious citation is affirmed.

## NOTICE OF DECISION

Secretary of Labor v. CHARLES OFFSET COMPANY, INC.
OSHRC Docket No. 81-0314

1. Enclosed is a copy of my decision. It will be filed with the Commission on April 8, 1982, and will become the final order of the Commission on May 10, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is May 10, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

New York, New York 10011
For the Respondent

## DECISION AND ORDER

Ditore, J.

## PRELIMINARY STATEMENT

Complainant moved to dismiss Respondent's untimely filed notice of contest to the total proposed penalty of $1320. A preliminary hearing on the issue was heard on May 28, 1981, before Judge James P. O'Connell. Prior to a decision by Judge O'Connell, the case was transferred to this Judge.

Respondent through its plant superintendent, Tony DeCesare, waived a new hearing and authorized this Judge to render a decision on the record made before Judge O'Connell on May 28, 1981.

STATEMENT OF THE CASE

Respondent's workplace located at 4-85 48th Avenue, Long Island City, New York, was inspected on October 23, 1980, by an OSHA compliance officer. The inspection resulted in the issuance on November 10, 1981, of two citations and a notification of proposed penalties totalling $1,320, to Respondent. Respondent acknowledged receipt of the citations and notification of proposed penalties on November 13, 1980 (Exh. C-1) but failed to file a notice of contest to the penalties within fifteen (15) working days, as prescribed by the Act (Exh. C-2).

On December 10, 1980, Respondent through its plant superintendent, Mr. DeCesare, filed a late (3 working days) notice of contest to the penalties. Respondent admits the late filing but maintains it was caused by a statement from OSHA's compliance officer that no penalties would be assessed if Respondent abated the violations. The violations were abated (Exh. C-3).

Complainant now moves to dismiss the notice of contest as untimely filed. A hearing was held on May 28, 1981, at New York, New York, to determine whether Respondent's failure to contest within the prescribed time divests the Commission of jurisdiction to determine the merits of the case.

## FINDINGS OF FACT

The credible evidence of record establishes preponderant proof of the following specific findings of fact.

1. On October 23, 1980, Compliance Officer Ernest Giangreco inspected Respondent's workplace located at 4-85 48th Avenue, Long Island City, New York. Mr. Giangreco met several of Respondent's employees including Respondent's plant coordinator, Mr. Anthony, the employer's representative, Mr. Mokrzycki and the union shop steward, Mr. Madorma. He also met briefly with Respondent's plant superintendent, Mr. DeCesare (T. 27).

2. After the inspection, a closing conference was held on October 29, 1980, with Mr. Mokrzycki and Mr. Madorma. Officer Giangreco explained to Mr. Mokrzycki and Mr. Madorma that Respondent had the right to contest any citation issued to it; and that if a citation or citations were issued, Respondent had fifteen (15) working days from its receipt of the citations, to file a written notice of contest to the citations and penalties (T. 28-31).

3. On November 13, 1980, Respondent received by certified mail, the two citations and notice of proposed penalties from Complainant (T. 6, 14).

4. The citations and notification included instructions regarding the procedures to be followed for filing a notice of

contest if Respondent decided to contest the citations and notification (citations; T. 20-21).

5. The citations with the notification were addressed to Mr. Bortner, Respondent's president, but were received by Mr. DeCesare, Respondent's plant superintendent, on November 13, 1980. Mr. DeCesare xeroxed the material and sent a copy to Mr. Bortner.

6. Mr. Bortner received the copy of the citations, and on November 13, 1980, discussed the proposed penalty with Mr. DeCesare, who recommended that the penalties be contested (T. 34).

7. Respondent failed to serve a formal notice of contest on or before December 5, 1980, (the fifteen working days limitation) (T. 15).

8. On December 8, 1980, as a result of Respondent's failure to timely file a notice of contest, OSHA, in writing, requested payment from Respondent of $1,320.00, the total amount of the penalties proposed (Exh. C-2).

9. On December 10, 1980, Respondent's plant superintendent, Anthony DeCesare, responded to OSHA's letter of December 8, 1980, by filing a formal but late notice of contest to the penalties. In the notice, Mr. DeCesare maintained that it was Respondent's understanding based on a conversation Mr. Mokrzycki and Mr. Madorama

had with the compliance officer, that no penalties would be assessed if the violations were corrected (Exh. C-3, T. 16, 18). Mr. DeCesare admits that Officer Giangreco made no such statement to him (T. 19).

10. Respondent did abate the violations at a cost of $5,800.00.

11. There is no evidence that either Compliance Officer Giangreco or any other representative of OSHA made any misrepresentation to, or practiced any deception on Respondent, to cause it to file a late notice of contest to the penalties.

12. There is no evidence of record upon which any finding can be made which would grant relief to Respondent pursuant to Rule 60(b)(1) and (6) of the Federal Rules of Civil Procedure, from the Order which became final by operation of law, and which affirmed the penalties.

## CONCLUSIONS OF LAW

1. The two citations and their proposed penalties issued to Respondent on November 10, 1980, and received by it on November 13, 1980, became final orders of the Review Commission by operation of law, on December 6, 1980.

2. This Commission lacks jurisdiction or authority to review the final orders.

O R D E R

Due deliberation having been had on the whole record, it is hereby

ORDERED that Complainant's motion to dismiss Respondent's notice of contest, is granted, it is further

ORDERED that the final orders, by operation of law, affirming the two citations and penalties, divests the Commission of jurisdiction in this case.

DECISION AND ORDER

RICHARD J. MURPHY, JUDGE

A workplace under the operation and control of Respondent was inspected by the Occupational Safety and Health Administration (OSHA) on August 6, 1980. The inspection was a general schedule inspection of a well service site at Pleasanton Well Service, Rig 805, Vernor Bedinger Well Site, Carrizo Springs, Texas. Respondent Pleasanton Well Service, Inc., was servicing an oil well there at the time of inspection.

As a result of that inspection, a citation was issued alleging in Item 1 a violation of Section 5(a)(1) of the Occupational Safety and Health Act of 1970 (29 U.S.C.651, et seq) (Act) in that Respondent did not protect employees from the recognized hazard of not having auxilliary means of egress in case of oil well fires, and alleging in Item 2 a violation of 29 CFR 1910.27(d)(5) in that cage protection, or ladder safety devices in lieu of cage protection, were not used on power, water, tank, or chimney ladders over 20 feet in unbroken length. Fines in the amount of $560.00 were proposed for each of the alleged violations.

On October 2, 1980, a formal complaint was filed which was answered by respondent by the 19th of December, 1980. On March 31, 1981 a petition was filed by Complainant asking leave to amend Item 1 to change it from a violation of 5(a)(1) (the general duty clause) to a violation of 29 CFR 1910.36(b)(1). On April 16, 1981, an order has entered allowing the amendment.

This case was heard on May 1, 1981, by Judge Jerry W. Mitchell. By order of February 8, 1982 it was reasigned to me because of the unavailability of Judge Mitchell to this Commission. By order of February 12, 1982, I informed the parties of my intention to decide this case upon the record made before Judge Mitchell and on consideration of the post-hearing briefs filed by the parties. That Order directed the parties to file any objections to that proposed handling by March 8, 1982. No objection has been filed.

Respondent stipulated that it is engaged in interstate commerce; that it has approximately 90 employees; and that it is subject to the jurisdiction of this Commission pursuant to section 10(c) of the Act. It is so found and concluded.

Complainant's exhibit 1 is a picture of Rig 805 taken at the time of the inspection. It is, as described by OSHA Compliance Officer Chapa on cross examination, a large truck rig on which is mounted a telescoping derrick which folds over on the truck bed for movement from place to place. Witness Chapa referring to the rig stated that "It is a mobile structure, yes. You can move it around"(Tr. 33). Rig 805 has platforms approximately 55 to 75 feet high on which respondent employees work. Those platforms are without escape exits.

Respondents defense to Item No. 1 is that 29 C.F.R.1910.36(b)(1) does not apply to Rig 805 for the reason that the rig is not a building or structure within the purview of that regulation.[1/] Respondent

---

[1/] 29 C.F.R.1910.36(b)(1) is as follows:

> (b) Fundamental requirements. (1) Every building or structure new or old, designed for human occupancy shall be provided with exits sufficient to permit the prompt escape of occupants in case of fire or other emergency. The design of exits and other safe guards shall be such that reliance for safety to life in case of fire or other emergency will not depend solely on any single safeguard; additional safe guards shall be provided for life safety in case any single safeguard is ineffective due to some human or mechanical failure.

refers to 29 C.F.R.1910.36(a) which specifically states that ". . . Exits from vehicles, vessels, or other mobile structures are not covered by this subpart," and cites Review Commission final orders in Secretary v Parker Well Service, Inc., 5 OSHC 1847 (1977), Secretary v Fairbanks Well Service, Inc., 5 OSHC 1873 (1977) which held that the cited standard is inapplicable to rigs consisting of telescoping derricks mounted on trucks for transportation from one well to another. Complainant argues that Rig 805 was subject to the standard because it is not mobile once it is set up at the worksite. This argument was explicity rejected in the Parker and Fairbanks cases. Complainant argues that Secretary v Fred Wilson Drilling Company, Inc., 6 OSHC 1942 (1978); sustained Wilson v Marshall 624F 2d 38 (5th Cir.1980) is contrary to Parker and Fairbanks. However, the rotary drilling Rig involved in the Wilson case is not truck mounted and is not comparable to Rig 805. I hold that 29 C.F.R1910.36(b)(1) is not applicable to Rig 805 and therefore vacate Item 1 of Citation 1.

In its Post trial brief Complainant moved to amend Item 1 of Citation 1 to include a violation of the general duty clause of Section 5(a)(1) of the Act. As heretofore noted, Complainant originally alleged violation of the general duty clause in Item 1. The order which allowed the complaint to be amended specified that the item would be tried under 29 C.F.R.1910.36(b)(1) and Respondent states that it structured its defense to that issue.

Respondent called no witnesses in its defense and in reply to the Post trial motion states that it would have presented a different defense against a general duty allegation. Respondent opposes the post trial motion on the ground that amendment after trial would be prejudicial to it. I so find and for that reason the motion to amend is denied.

Respondent does not contend that Rig 805 was not subject to the standard set forth in 29 C.F.R.1910.27(d)(5). The picture introduced as Exhibit 1 shows a ladder from the truck bed of the Rig to a platform 65 feet above ground. The ladder was not equipped with cage protection or safety devices that incorporate lifebelts to supply protection against falls. Respondent's foreman,called as a witness for complainant, testified that employees worked on the platform shortly before the inspection and that they climbed the ladder to reach the platform. Witness Chapa testified that a fall from the ladder could cause death or serious injury, and I so find.

Respondent's defense is that a new management commenced operating Respondent in the summer of 1980, several months before the inspection that resulted in the citation at issue here; that a former Loss Control Representative for an insurance corporation with oil field experience was hired as Respondent's safety manager; that he had made a safety inspection of all of Respondent's oil well servicing rigs and had ordered ladder safety devices for all rigs; that ladder safety devices had been installed on six of the company's fifteen rigs at the time of the inspection with the other devices back ordered. The fact that a new

management was actively correcting safety deficiencies it found when it commenced operating respondent a few months before the inspection is not a defense to Item 2 of the Citation. However, it is a factor that should be considered in fixing the penalty. Item 2 is affirmed but the penalty is reduced from the $560.00 sought by complainant to $250.00

## ORDER

Based on the foregoing findings and conclusions it is ordered that:

(1) Item 1 of Serious Citation No. 1 for violation of 29 C.F.R.1910.36(b)(1) is vacated.

(2) Item 2 of Serious Citation No. 1 for violation of 29 C.F.R.1910.27(d)(5) is affirmed and a penalty of $250.00 is imposed.

1100 Commerce Street
Dallas, Texas 75242

NOTICE OF DECISION

Secretary of Labor v. Ray Cook Corporation
OSHRC Docket No. 81-1120

1. Enclosed is a copy of my decision. It will be filed with the Commission on April 12, 1982, and will become the final order of the Commission on May 12, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is May 12, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

| RAY COOK CORPORATION, Respondent. | : | |

Appearances: Frances V. Valdez, Esq., and Jack Ostrander, Esq., for the Complainant.

Bob Coleman (Pro Se) for the Respondent.

DECISION

This is a proceeding under Section 10(c) of the Occupational Safety and Health Act of 1970. As a result of a general schedule inspection made after obtaining a warrant the respondent was issued a citation alleging 11 violations of the safety standards promulgated under the Act and set forth in Title 29 of the Code of Federal Regulations, Part 1910. The respondent contested the citation and a hearing was held in the matter on January 29, 1982 at Houston, Texas.

Item 1A - Alleged Violation of 29 CFR 1910.107(c)(6)

The overhead fluorescent two-bulb light fixture located within the spraying area of combustible residues was not of the explosion-proof type approved for Class I, Group D locations conforming to the provisions of Class I, Division I, hazardous locations

Two employees were observed by the compliance officer spraying a flammable lacquer on golf clubs in the back area of respondent's plant. (Tr. 16). The above-described light fixture was in place at the spraying area. The lacquer being used had a flash point of 21 degrees Fahrenheit, assuming the airborne vapors were in the required concentration. (Tr. 21). The inspector was not able to tell what concentration of vapors would cause an explosion at 21 degrees. (Tr. 63). The inspector did not examine the light fixture closely enough to observe whether it was marked for use in the spraying area. (Tr. 26). An exhaust fan was in use for the purpose of drawing overspray from the atmosphere and venting it to the exterior of the building. (Tr. 29). The respondent contended that the spray operations were normally conducted outside the building, and that inside spraying was infrequently done because of unsuitable weather conditions. (Tr. 28).

I am of the opinion that a critical element of the government's case has not been proved. That is, the specific concentration of alleged flammable vapors which existed at the time of the inspection. There is also the question of whether the light fixture might have been suitable for the spraying operations. The latter question depends once again on the missing element, the concentration of vapors existing at the time of the alleged violation. In the circumstances

I conclude that the complainant has failed to prove a violation of the described safety standard.

Items 1B and 1C of the citation will be vacated for the same basic reason, i.e., the lack of specific information regarding the concentration of vapors, since proof of the violations depends on the existence of a dangerous concentration of such vapors.

Items 2A, 2B, and 2C - Alleged Violation of 29 CFR 1910.215(a)(2), 29 CFR 1910.215(a)(4), and 29 CFR 1910.215(b)(9)

These items deal with the compliance officer's observance of a 1/3 horsepower bench grinder which lacked safety guards, and proper adjustment of work rests. Nor were tongue guards provided, as required. The respondent essentially admitted the violations, but objects to their characterization as "serious." I would agree with the respondent in this respect. The grinder is used very infrequently, and generally only by the master machinist who supervises the operations of the plant. (Tr. 42). These items will be affirmed, but as "non-serious" violations of the standards. The adjustment of work rests and the provision of guards was made within 24 hours of the inspection. No penalty will be assessed for the violations.

Items 3A through 3E - Alleged Violations of 29 CFR 1910.217(c)(1)(i), (b)(3)(i), (e)(1)(i), (e)(1)(ii), and 29 CFR 1910.219(b)(1).

These deal with the inspector's observance of a power press which was not equipped with a point of operation guard; which did not incorporate a single-stroke mechanism; which was not the subject of periodic and regular

inspections; and which had flywheels 7 feet or less above the floor without guards.

Exhibit No. C-9 shows the mechanical press observed by the compliance officer. It has no point of operation guard, i.e., an employee could accidentally place some portion of his body, more than likely the upper extremities, including hands and fingers, into the point of operation and sustain a crushing, perhaps amputating injury to the particular member. (Tr. 46). Additionally, the press was equipped with continuous punch action, as opposed to the single-stroke mechanism required by the standards, in order that safer control be maintained over the machine. (Tr. 47,48). The flywheel was exposed to employee contact upon operation. (Tr. 48). Some portions of the rotating machinery were protected. (Tr. 49). No records pertaining to inspection of the press were maintained by the respondent. (Tr. 52). The employee who used the press, for punching lead weights into putter heads, stated that he activated the press with a foot pedal, dropping his hands to his sides, and standing about 20 to 36 inches away from the point of operation. (Tr. 49,50). This, in my opinion, does not indicate that a point-of-operation guard is not required to obviate the hazard presented. It is the first injury that the Act attempts to prevent, not the second or third. In the particular circumstances here shown the hazard was made greater by the continuous-stroke mechanism incorporated in the machine. It is clear that the respondent violated all of the standards shown under items 3A through 3E of the citation. They will be affirmed. The penalty proposed, $90.00, appears to be proper.

## CONCLUSIONS OF LAW

1. The Review Commission has jurisdiction. (Stipulated by the parties).

2. The respondent did not violate the safety standards set forth at 29 CFR 1910.107(c)(6); 107(d)(6); or 107(g)(2).

3. The respondent violated the safety standards set forth at 29 CFR 1910.215(a)(2); 215(a)(4); 215(b)(9). The violations were non-serious.

4. The respondent violated the safety standards set forth at 29 CFR 1910.217(c)(1)(i); 217(b)(3)(i); 217(e)(1)(i); 217 (e)(1)(ii); and 219(b)(1). These violations were serious. A penalty of $90.00 will be assessed for the violation of 29 CFR 1910.217(c)(1)(i).

## ORDER

1. Items 1A, 1B, and 1C of the citation are vacated.

2. Items 2A, 2B, and 2C of the citation are affirmed as non-serious violations of the Act, with no penalty assessed.

3. Items 3A through 3E of the citation are affirmed as serious violations of the Act, with a penalty of $90 assessed against the respondent for the violation of 29 CFR 1910.217(c)(1)(i).

So ORDERED.

ORDER ON MOTION TO DISMISS

Respondent's Motion to Dismiss citations issued under the coke oven emissions standards (29 CFR 1910.1029) is granted.

The chronology and factual background is briefly summarized, setting forth facts not in dispute and stipulated by the parties:

1. On October 19, 1976, the Secretary of Labor promulgated a new health standard governing employee exposure to coke oven emissions (29 CFR 1910.1029).

2. Petitions for review were filed by several coke producers and their trade associations with the United States Court of Appeals for the Third Circuit. The Court issued its opinion and order

on March 28, 1978, American Iron and Steel Institute, et al. v Occupational Safety and Health Administration, 577 F.2d 825 (3rd Cir. 1978) which held in pertinent part, "the Secretary's coke oven emissions standard (is) affirmed except: . . . . . (3), application of the standard to non-coke oven employers." The court remanded the case for further proceedings consistent with its opinion as to the application of the standard to non-coke oven employers.

3. Respondents are non-coke oven employers who were engaged in construction and maintenance services, as independent contractors, at the Inland Steel plant, East Chicago, Indiana, in August 1978.

4. They were cited in September and October 1978, for violation of the standard.

5. In December 1978, OSHA issued a "Supplemental Statement of Reasons" which states, "This notice delineating the precise application of the standard to non-coke producing employers is in response to the remand ordered by the Court."

6. On January 12, 1979, OSHA published a notice in the Federal Register at page 2725 stating that the Advisory Committee on Construction Safety and Health, (Advisory Committee) would meet on January 31 and February 1, 1979 to consider the application of the

coke oven standard to non-coke oven employers. The Supplemental Statement was then presented to the Advisory Committee.

7. The Advisory Committee met on May 17, 1979, pursuant to a notice in the Federal Register on April 27, 1979, and formulated its recommendations. The Advisory Committee accepted OSHA's determination that the scope and application of the standard, (29 CFR 1910.1029) (a)) applied to all employers. Some disagreement was expressed with parts of the Supplemental Statement. The areas of disagreement have no direct bearing on the issue raised here.

Complainant's position is that the order of remand did not stay enforcement proceedings against non-coke oven employers. Consistent with its position, the Secretary did not institute any rule making proceeding. Instead, a "Supplemental Statement of Reasons" was drafted for public consideration for the purpose of informing the Court of the precise application of the standard to independent contractors.

Respondents maintain that the citations were issued in violation of the Court order and are invalid. Respondents argue that the Court was concerned with due process rights to notice and they were not afforded such notice. Respondents were cited in the interim period between the Court order and publication in the Federal Register of the "Supplemental Statement of Reasons."

The Court's opinion, section VI, deals with the application of the standard to non-coke oven employers. The Court recites the arguments favoring the Secretary's position; announces its conslusion that, despite these arguments, notice was inadequate; and finally gives reasons for its conclusion (577 F.2d at 840). The case was remanded for further proceedings consistent with the opinion. A plain and logical reading would indicate that the Court was indeed concerned with due process rights to notice.

The case law submitted by the parties in support of their interpretations of the opinion and order is inconclusive. The decision cited do not involve notice of rule making, or the court specifically vacated or remanded with specific instructions for proceeding, or specifically ruled that the challenge should be pursued in an enforcement proceeding. However, I find respondent's argument and analogy to the Review Commission decision, in American Urethane Corp., 5 BNA OSHC 1543, 1977-78 CCH OSHD para. 21, 903 (1977) to be persuasive. In American Urethane Corp., the Review Commission interpreted the Third Circuit opinion in Synthetic Organic Chemical Mfrs. Ass'n (SOCMA II), 506 F.2d 385 (3rd Cir. 1974) cert. denied 423 U.S. 830 (1975). The Review Commission held that a Court order of remand does not stay enforcement proceedings where

the basis for the remand is the Court's desire to ascertain the reasons for the agency action. In contrast, when the basis for remand is failure to afford adequate notice, remand was predicated on the conclusion that the promulgation did not meet the requirements of section 6 of the Act and necessitates vacation of the relevant provisions. This conclusion is in accord with the view that an administrative rule not promulgated in accordance with the notice requirements of section 553 of the Administrative Procedure Act is not enforceable. N.L.R.B. v Wyman-Gordon Company, 394 U. S. 759 (1969); Wagner Electric Corp. v Volpe, 446 F.2d 1013 (3rd Cir. 1972); Texaco, Inc. v Federal Power Commission, 412 F.2d 740 (3rd Cir. 1969).

The Court has ruled that respondents did not receive adequate notice. Proceedings, in accordance with the Court order of remand, were not held prior to the issuance of the citations. The defect in promulgation precludes enforcement of the standard against respondents in this case. It is noted that the same issue was before Judge Sparks, Review Commission Judge, in C. H. Heist Corporation et al. (OSHRC Nos. 79-0749 et al., decided November 16, 1979). Judge Sparks held that lack of notice was a fundamental defect and that the standard should not be enforced until the defect has been remedied.

It is ORDERED:

1. The citations alleging violations of 29 CFR 1910.1029 are vacated.

2. General Drainage, Inc., No. 78-5043; M & O Insulation Company, No. 78-5051; and McAuliffe Mechanical Contractors, No. 78-5060 will be notified of the hearing date with respect to those items cited under standards other than 29 CFR 1910.1029.

3. This constitutes a final order with respect to Furnco Construction Co., No. 78-4731; and J. L. Manta, Inc., No. 78-4923.

Louis J. Rubin
Judge, OSHRC

Dated: December 7, 1979

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

---

RAYMOND J. DONOVAN, SECRETARY OF LABOR,

Complainant,

v.

OSHRC DOCKET No. 78-4731

FURNCO CONSTRUCTION COMPANY,

Respondent.

---

STIPULATION AND SETTLEMENT AGREEMENT

I

The parties hereby enter into this stipulation and settlement agreement as full and complete settlement of the instant case which is presently pending upon review before the Occupational Safety and Health Review Commission.

II

The parties stipulate as follows:

(A) The Occupational Safety and Health Review Commission (hereinafter "the Commission") has jurisdiction of this matter pursuant to section 10(c) of the Occupational Safety and Health Act of 1970 (84 Stat. 1590, 29 U.S.C. §651 et. seq.) (hereinafter "the Act").

(B) Respondent, Furnco Construction Company (hereinafter "Furnco"), is a New York corporation engaged as an independent contractor in specialized construction and maintenance activities for various heavy industries including

the steel industry. During the course of its business its employees are engaged in these activities. Furnco uses equipment and material from places located outside the State of New York. Furnco was and is an employer engaged in a business affecting commerce within the meaning of sections 3(3) and 3(5) of the Act and employed employees within the meaning of section 3(6) of the Act.

(C) As a result of a inspection conducted on August 1-2, 1978, at Furnco's workplace at the Inland Steel coke oven battery in East Chicago, Indiana, one citation for ten violations of 29 CFR 1910.1029 was issued to Furnco on September 27, 1978, pursuant to section 9(a) of the Act.

(D) On September 27, 1978, pursuant to section 10(a) of the Act, a notice of proposed penalty recommending a penalty of $9,700 was sent to Furnco by certified mail, return receipt requested.

(E) By letter dated October 5, 1978, Furnco timely contested the citation and proposed penalty. Furnco's notice of contest was duly transmitted to the Commission.

(F) On September 21, 1979, Furnco along with other respondents in a consolidated case, including J.L. Manta, Inc., (Docket No. 78-4923), moved to dismiss on the grounds that the cited standard, 29 CFR 1910.1029, did not apply. The administrative law judge filed his decision and order, granting respondent's motion to dismiss, on December 7, 1979.

(G) On December 28, 1979, the Secretary filed a petition for discretionary review. On January 7, 1980 then-Chairman Timothy F. Cleary directed the case for review.

(H) On November 23, 1980, the Secretary filed his brief in this case against Furnco and J.L. Manta, Inc. In the brief he abandoned his claim that 29 CFR 1910.1029 applied to the cited conditions and moved to amend the citation to allege violations of other standards, as set forth below.

III

Complainant hereby moves to withdraw Items 2, 5, 6a, 6b, 7, 8(a), and 9 of the original citation because of a lack of evidence including evidence, necessary to overcome Furnco's defense that, due to the particular contractual arrangements and physical conditions at the worksite, it was infeasible for it to provide the required facilities and programs set forth in the aforementioned items. Complainant agrees to amend the other items as follows: (a) Furnco, at the aforementioned workplace on August 1, and August 2, 1978, violated section 5(a)(2) of the Act and the following occupational safety and health standards duly promulgated pursuant to section 6(a) of the Act. (Each portion below denoted by a number is a new citation item, e.g. (1) is citation item 1. Each subportion below denoted by a letter is a new citation subitem, e.g. (1)a is citation subitem 1a. The original citation item to which the new item or subitem is related is set forth in parentheses following the portion or subportion.)

(1)a. 29 CFR 1926.55(a). Exposure of a employee to inhalation of coal-tar pitch volatiles at a concentration above the one specified in the "Threshold Limit Values of Airborne Contaminants for 1970" of the American Conference of Governmental Industrial Hygienists (see table Z-1 in 29 CFR 1910.1000) was not avoided in that an ironworker welding on the west end of Coke Oven Battery C was exposed to coal-tar pitch volatiles at concentrations greater than 0.2 milligrams per cubic meter of air averaged over an 8-hour period. (Original item 1).

b. 29 CFR 1926.55(b). Protective equipment as described in 29 CFR 1926.103(b)(3) (Table E-4) was not used to keep the exposure of an employee working in the Regulated Areas associated with Coke Oven Battery C to coal-tar pitch volatiles within the limits prescribed in 29 CFR 1926.55(a) in that the employer did not assure the use of an air-purifying, half-mask, or mouthpiece respirator with filter pad or cartridge, an air-line respirator, or a hose-mask without blower for the ironworker welding at the west end of coke oven battery C when he was exposed to coal-tar pitch volatiles at concentrations greater than 0.2 milligrams per cubic meter of air averaged over an 8-hour period. (Original subitem 3a).

c. 29 CFR 1926.103(c)(1). Employees working in Regulated Areas associated with Coke Oven Battery C required to use one of the types of respirators mentioned in 1(b) were not

instructed in the use and limitations of such equipment. (Original subitem 3(b)).

d. 29 CFR 1910.134(b)(1). Written standard operating procedures governing the selection or use of respirators were not established for employees working in Regulated Areas associated with Coke Oven Battery C. (Original subitem 3b).

e. 29 CFR 1910.134(b)(6). Respirators for employees working in Regulated Areas associated with Coke Oven Battery C were not stored in a convenient, clean, or sanitary location. (Original Subitem 3b).

2. 29 CFR 1926.51(f). The employer did not provide adequate washing facilities for employees engaged in operations where coal-tar pitch volatiles might be harmful to employees, i.e. employees in the Regulated Areas associated with Coke Battery C. (Original subitem 8(b)).

3. 29 CFR 1926.21(b)(2). The employer did not instruct each employee working in the Regulated Areas associated with Coke Oven Battery C in the recognition and avoidance of unsafe conditions and the regulations applicable to his work environment to control or eliminate any hazards or other exposure to illness or injury. (Original item 10).

(b) With respect to amended Citation Item (1)a, alleging violation of 29 CFR 1926.55(a), compliance with the permissible exposure limit may be achieved by means other than engineering and work practice controls. In particular, if Furnco assures that its employees use respirators which comply with the requirements of 29 CFR 1926.55(b) and if Furnco institutes a respiratory protection program in accordance with 29 CFR 1926.103(c)(1) and 29 CFR 1910.134, Complainant represents to and assures Respondent that it will not be cited under 29 CFR 1926.55(a) for allowing its employees to work where the ambient air contains coal-tar pitch violatiles in excess of the permissible exposure limits.

Complainant hereby agrees to reduce the original proposed penalty from $9,700 to $1,000. Furthermore, Complainant hereby moves to withdraw its petition for discretionary review of the judge's decision with respect to Furnco only.

IV

Furnco hereby moves to withdraw its notice of contest of the citation and the penalty proposed therefor, as amended above, submits that it has abated the violations of the Act set forth in the citation, as amended, and agrees to pay the proposed penalty, as amended above ($1000.00), within fifteen (15) days from the filing of this stipulation and settlement agreement with the Commission.

V

Complainant and Furnco move to sever J.L. Manta, Inc., Docket No. 78-4923, from this case. J.L. Manta, Inc. consents to this severance.

VI

Complainant and Furnco hereby agree to bear their own fees and other expenses incurred by them in connection with any stage of this proceeding.

VII

Furnco agrees to post this Stipulation and Settlement Agreement in accordance with Commission Rule 7.

VIII

Except for this matter between the Secretary of Labor and Furnco, and except for the issuance by the Secretary of Labor of a notification of failure to correct these alleged violations or any other subsequent OSHA proceeding between Complainant and Furnco, none of the foregoing agreements, statements, findings and actions taken by Furnco shall be deemed an admission by Furnco of the allegations contained within the Citation and Notifications of Penalty or the Complaint. The agreements, statements, findings and actions taken by Furnco herein are made only for the purpose of compromising and settling this matter economically and amicably, and they shall not be used for any other purpose whatsoever, except as herein stated.

IX

Upon approval of this agreement by the Commission, the agreement shall constitute a final order of the Commission.

WHEREFORE, Complainant and Furnco request the Commission to approve this Stipulation and Settlement Agreement.

FOR THE COMPLAINANT
RAYMOND J. DONOVAN
SECRETARY OF LABOR

APPEARANCES: EUGENE F. DESHAZO, Esq., U.S. Department of Labor, Office of the Solicitor, Kansas City, Missouri, for the Complainant

ALFRED J. HOFFMAN, Esq., Columbia, Missouri, for the Respondent

Wienman, Judge, OSHRC

## STATEMENT OF THE CASE

This is a proceeding wherein Respondent contests a citation which alleges violations of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651, et seq.) at a Missouri Farmers Association ("MFA") grain elevator in Odessa, Missouri. The citation charged two violations of

Section 5(a)(1) of the Act, the so-called "General Duty Clause"[1/] in connection with the procedures Respondent employed in cleaning the grain receiving pit area under the elevator. Respondent timely contested the alleged violations, the time allotted for abatement, and the proposed penalties. The cause was assigned to the undersigned Judge by an order of reference dated November 6, 1980, and a hearing was held in Kansas City, Missouri, on February 25, 1981.

## THE ISSUES

No jurisdictional matters remain in issue. The parties pleaded facts sufficient to establish that Respondent is subject to the Act, and that the Commission has jurisdiction of the parties and the subject matter.

Both citation items charged Respondent with failure to furnish employment free from recognized hazards likely to cause death or serious physical harm to an employee. Specifically, the Secretary alleged the violations occurred when MFA permitted an employee to enter the basement of a grain elevator to remove an accumulation of grain without first testing the atmosphere or providing safety belts and lifelines. This citation described the allegedly hazardous activity as follows:

---

1/ Section 5(a)(1) provides:

> (a) Each employer--
>
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;

Monitoring for oxygen deficiency and for the presence of toxic and explosive vapors was not conducted prior to employee's entry and work in the pit the day it was cleaned, (Item 2); and

Safety belts and lifelines were not provided for quickly removing an employee from a confined space in case of an emergency (Item 1).

By way of defense Respondent contends that the Secretary failed to prove the essential elements of a "General Duty Clause" violation, namely:

1. that a hazard existed;

2. that the hazard was one recognized by the industry or that the employer had actual knowledge of the hazard;

3. that the hazard was likely to cause death or serious injury;

4. that the employer knew or should have known of the hazard; and

5. that feasible measures could have been employed to prevent the hazard.

Thus the issues for decision are whether the evidence establishes the existence of violations as alleged in the citation, and, if so, the assessment of an appropriate penalty.

## SUMMARY OF THE EVIDENCE AND DISCUSSION

The OSHA inspection in August of 1980 was conducted pursuant to a complaint filed by Jerry Ellis, a former Odessa MFA Exchange employee. Mr. Ellis managed the fertilizer and grain storage portion of the MFA facility on the July day when another employee, Jesse Vaughn, entered the basement pit area. Considerable testimony was devoted to the circumstance surrounding this episode, and the pertinent facts are summarized as follows:

The MFA grain elevator at Odessa, Missouri, is a country terminal where three employees are engaged in receiving, storing, and loading out grain. It is part of a facility where 22 employees work, most of whom are located approximately one mile from the elevator (T. 34-35).

Witnesses disagreed as to the exact dimensions of the receiving pit under the elevator, but the consensus indicated an area approximately fifteen feet in height, twelve feet wide, and thirty feet long (T. 36, 50, 61, 158). As a result of operations, over a period of time approximately 75 to 100 bushels of corn, wheat, and soybeans had spilled onto the basement floor (T. 36, 50, 61). About two-thirds of the accumulation had become damp (T. 46, 54, 71) and the grain emitted a strong "rotten egg" odor (T. 38, 51).

In July Ron Soendker, manager of the facility, instructed Ellis to remove the grain from the basement. Ellis refused, and an argument ensued concerning the method to use. Ellis wanted to employ a septic tank company while Soendker wanted Ellis and the two men in his charge to remove the grain.

Ellis maintained that the job was not safe and refused to enter the pit or order employees to do so (T. 38). However, Jesse Vaughn volunteered to do the work and entered the basement and began removing grain by filling a bucket.[2/] Vaughn suffered no ill effects, nor did Soendker who testified that he had inspected the pit earlier in the day (T. 157).

Vaughn had descended into the area through a small square manhole

---

2/ He abandoned the job after about one-half hour. It was hot work, and due to the argument between Soendker and Ellis, nobody was bothering to raise the bucket after Vaughn filled it (T. 70). Later a septic tank service firm was hired to finish the chore.

depicted in Exhibit C-1. Witnesses for the Secretary contended this opening was the only source of ventilation. Soendker testified that there were openings in the "legs" which carried grain from the pit and in the grill where the grain was dumped (T. 159). However, MFA testimony suggesting there was active air movement in the pit was contradicted by Vaughn who detected no ventilation (T. 63-64).

It was undisputed that there had been no testing for oxygen deficiency or toxic substances before Vaughn entered the pit since the elevator possessed no monitoring equipment. Vaughn had not been outfitted with a safety belt, harness, or other rescue gear although the elevator owned a safety belt.

The Secretary's contention that Vaughn's entry into the pit under these conditions subjected him to recognized hazards was articulated in the testimony of Carl Astley, industrial hygiene supervisor in OSHA's Kansas City area office, and Charles J. Bryant, corporate industrial hygienist for Farmland Industries. Neither had visited the worksite, but each made inferences from the testimony of Ellis, Vaughn, and Harold Straggs, the third employee.

Mr. Astley concluded that chemical reactions in the wet and decomposing grain pile could produce such by-products as hydrogen sulfide, methane, nitrogen, and carbon dioxide. These various chemicals posed potential hazards as asphyxiators, systemic poisons, or explosive and combustible gases. An employee entering the pit would be subject to a two-fold hazard: the atmosphere might have been oxygen deficient and life threatening because of toxic chemicals, and the lack of safety belt or harness would endanger both the stricken employee and any would-be

rescuers (T. 73-84).

Astley asserted that a potential hazard was created whenever an oxygen-consuming chemical reaction occurred in a confined space, and that such atmospheres should always be monitored before entry (T. 93-96).

On cross-examination Astley testified that he used "confined space" as a word of art and that he did not know if a "country elevator fellow" would know exactly what he meant by the term (T. 98).

In response to a question from the Judge, Astley stated that he believed, from what he was able to read, that the hazard posed by wet grain in a confined space was one recognized by the industry (T. 107). He identified his sources as trade associations, NIOSH, and safety organizations (T. 108).

Mr. Bryant, an industrial hygienist formerly employed by NIOSH, stated that his employer, Farmland Industries, was the "Number 2" grain handler in the nation with 100,000,000 bushel capacity in fifteen terminal elevators. As part of his duties he advised these large elevators on safety procedures; he did not deal directly with smaller cooperative elevators (T. 119).

Bryant testified that under the circumstances existing at the Odessa elevator, he would have recommended atmospheric testing before entry into the pit (T. 122). A hazard could have existed, and the failure to monitor for oxygen deficiency or combustible gases would have been a recognized hazard at Farmland Industries (T. 124-125). Also, the Farmland safety program Bryant developed includes the use of lifelines and harnesses for anyone entering a confined space (T. 126-127).

On cross-examination Mr. Bryant repeated that he did not work with country elevators and did not know if such elevators possessed oxygen monitoring equipment (T. 129). He declared there was no way to tell whether one bushel of grain in a space 30' x 12' x 15' would create a hazard without atmospheric testing (T. 129). He did not know if a country elevator operator would recognize a hazard under the circumstances at Odessa (T. 134). He believed that a prudent person, with some knowledge of the potential hazards, would have monitored before entering the pit area (T. 138). But there was no concrete rule for comparing bushels of rotting grain to cubic feet of space to determine when there was a hazard; therefore, it was necessary to use a lot of discretion (T. 139).

Respondent expressly challenged the Secretary's claim that failure to monitor the atmosphere under the conditions was a hazard recognized by the industry. A number of MFA officials boasting considerable country grain elevator experience declared that sending Vaughn into the pit area without prior monitoring was not a violation of recognized safety practices in the industry. Moreover, Soendker testified that he had conducted a survey of grain elevators in the Odessa, Missouri, neighborhood and found that none had monitoring detection equipment "and they don't even know what you are talking about whenever you say it" (T. 161).

The Secretary did not rebutt this substantial testimony relative to industry safety practices, nor did he call attention to any specific instances of an elevator employee suffering harm because he entered a pit area under similar circumstances.

The Secretary's evidence was persuasive that decomposing grain in an elevator pit area with little or no active air movement creates a condition where occurrence of a hazardous incident is possible. However, the standard of proof for a Section 5(a)(1) violation focuses not on whether a serious injury was possible, but on whether the hazard was "recognized," and the term "recognized" connotes knowledge. As stated by Judge Timbers in Usery v. Marquette Cement Mfg. Co., 568 F.2d 902 (2nd Cir., 1977), to "constitute a recognized hazard, the dangerous potential of a condition or activity must actually be known either to the particular employer or generally in the industry." Supra, 568 F.2d at 910.

The proof herein fails to establish the requisite knowledge, either in the possession of MFA or the industry generally. It is unnecessary to discuss MFA's actual knowledge of any hazards since Respondent's officials have consistently maintained that the conditions in the pit presented no danger to employees. Whether this belief was fact or fancy is not relevant to the question of MFA knowledge; the earnestness with which Respondent denies the existence of hazards negates any theory that the employer had actual knowledge that its practices exposed an employee to danger.

The evidence in support of a theory that the industry generally would recognize hazards herein likewise has little support in the record. Astley and Bryant, the Secretary's two witnesses who addressed themselves to this issue, made no claims about actual industry practices. Astley referred to studies conducted by trade associations and safety organizations, and a number of articles were introduced into the

record (Ex. C-2, C-4, C-5, and C-6). None of this literature appeared to be specifically related to the instant conditions, however, and we cannot conclude that precautions appropriate before entry into enclosed food bins, fumigated tank cars, etc., are necessary before entry into a receiving pit area under an elevator.

Mr. Bryant carefully limited his testimony to procedures he would have recommended under the circumstances, but he expressly denied any knowledge of country grain elevator practices in this regard (T. 129, 134).

It was clear that both Astley and Bryant, well-qualified industrial hygienists, counseled extreme caution before sending an employee into an area where there was even a possibility of serious injury or death because of gases released by decomposing grain. However, their professional recognition of a potential hazard does not establish the existence of a recognized hazard within the meaning of Section 5(a)(1). The industrial hygienists are persuasive that there was a plausible theoretical possibility that Vaughn's entry into the pit area under the conditions could have resulted in serious injury or death. But an employer is not in violation of Section 5(a)(1) whenever the occurrence of an incident capable of causing an employee serious injury is not impossible. Congress did not intend the term "recognized" to be so broadly construed. See, Secretary v. Pratt & Whitney, Aircraft Division of United Technologies Corp., (2nd Cir., April 20, 1981), CCH OSHD ¶25,329.

Since the record is devoid of substantial evidence that the industry recognized as hazardous the conditions and practices described in

the two citation items, the Secretary has failed to bear the burden of proof, and the General Duty Clause allegations must be vacated.

## FINDINGS OF FACT

A preponderance of the reliable, probative, and substantial evidence supports the findings of fact set forth in the Summary of Evidence and Discussion.

## CONCLUSIONS OF LAW

1. At all material times Respondent was an employer within the meaning of Section 3 of the Occupational Safety and Health Act of 1970.

2. Jurisdiction of this proceedings is conferred upon the Occupational Safety and Health Review Commission by Section 10(c) of the Act.

3. The evidence fails to establish the existence of any violations of Section 5(a)(1) of the Occupational Safety and Health Act of 1970.

## ORDER

Based on the above Findings of Fact and Conclusions of Law, it is ORDERED that items 1 and 2 of citation number 1 issued to Respondent September 4, 1980, are vacated.

DIRECTION FOR REVIEW AND REMAND

Pursuant to section 12(j) of the Occupational Safety and Health Act of 1970, 29 U.S.C. § 651-678 ("the Act"), the order of Administrative Law Judge Irving Sommer, dismissing respondent's notice of contest, is hereby directed for review. For reasons that follow, we vacate the Judge's order.

After Judge Sommer issued his order, the Secretary served the Commission with a copy of correspondence between the Secretary and Respondent regarding a possible settlement of the case. The Secretary has not, however, submitted a copy of the proposed settlement to the Commission. In view of the possibility that this case may be settled, and in consideration of the Commission's policy encouraging settlement, we remand the matter to the Judge for such further proceedings as may be appropriate.

SO ORDERED.

| SECRETARY OF LABOR<br>Complainant<br>v.<br>DUGGAN & MARCON, INC.<br>Respondent | DOCKET NUMBER 81-2716 |

ORDER

The Respondent was notified by the Executive Secretary of the Commission that Commission Rule 7 requires that notice of contested cases be given to affected employees. A postcard for certifying posting and service together with a notice for informing employees of their rights was enclosed. The Respondent failed to respond to this direction.

Thereafter the Secretary filed a complaint herein on January 5, 1982, to which the Respondent has not filed an answer to date.

On March 3, 1982, I issued a show cause order to the Respondent concerning his failure to file proof of service of the Notice of Contest on affected employees and his failure to file an answer. The Respondent failed to respond to the show cause order. It is apparent the Respondent is abandoning his right to contest the citations herein.

Accordingly, the Respondent's Notice of Contest is dismissed. Citation Number 1 for serious violations issued December 8, 1981, with penalties assessed of $800 is affirmed, and Citation Number 2 for nonserious violations and no penalty assessed is affirmed.

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>WEISBLATT ELECTRIC COMPANY, INC.,<br>Respondent. | OSHRC Docket No. 79-2537 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The only issue in this case is whether Respondent, Weisblatt Electrical Company ("Weisblatt"), a subcontractor on a multi-employer construction site, took reasonable steps to protect its employees from violative conditions that it neither created nor controlled. We find that Weisblatt did take such steps and vacate the citations.

I.

Weisblatt had been engaged to install an elevator in a six-story building that was apparently undergoing renovation. On the day the alleged violations occurred, two of Weisblatt's employees had returned to the site after a ten-day absence. According to Weisblatt's president, the company "must have left [the worksite] six or seven times, not only for safety [reasons] but for the whole general tenor and the processing of the job." He stated that the general contractor "would call us in, [but] they weren't prepared for us to work or it was just a horrible condition." The president declared that the employees had

returned to the worksite to determine "what the conditions were and [to] make a decision as to whether we stay or we will not stay."

About a half-hour after Weisblatt's employees arrived at the site for this purpose, but before they had begun to work, they met a compliance officer representing the Secretary of Labor who was inspecting the site based on a complaint of unsafe working conditions. The compliance officer testified that he told Weisblatt's employees that they had already been exposed to two falling hazards by walking up an unguarded ramp to the first floor of the building and walking near the unguarded open side of the first floor. The compliance officer also testified that the two employees were exposed to the hazards presented by unguarded floor openings on the first floor. At the request of Weisblatt's foreman, he agreed to inspect their work area on the fourth floor after he interviewed the general contractor. Subsequently, the general contractor began to install a railing on the access ramp. The compliance officer later inspected Weisblatt's work area and advised Weisblatt's employees that the area was safe. However, he also told them that they had been exposed to falling and tripping hazards on the stairways they had used to get to the fourth-floor work area; the hazards resulted from the lack of railings on the stairs and absence of material in the hollow pan-type treads on the individual risers. Weisblatt's president testified that its employees would not have remained on the site if the compliance officer had not been present.

As a result of the inspection, the Secretary issued two citations alleging that Weisblatt violated section 5(a)(2), 29 U.S.C. § 654(a)(2) of the Occupational Safety and Health Act of 1971, 29 U.S.C. §§ 651-678 ("the Act"). Citation 1 alleged that Weisblatt had failed to comply with 29 C.F.R. § 1926.500(b)(1)(unguarded floor openings), (d)(1)(unguarded open-sided floor), (d)(2)(unguarded runway), and (e)(1)(ii)(unguarded stairs). Citation 2 alleged a failure to comply with 29 C.F.R. § 1926.501(f)(unfilled pan-type treads). The Secretary

proposed a total penalty of $1,500 for the violations alleged in citation 1 and $0 for the violation alleged in citation 2.

Weisblatt did not deny before the judge that these violative conditions existed. Instead, its president argued at the hearing that it neither created nor controlled the hazards. Weisblatt's president argued that the company had complained to the general contractor about conditions at the worksite, and that its employees were on the worksite to determine whether the conditions made it safe to work. If it was not safe to work, it was company policy to leave the job.

Judge Ditore affirmed both citations. He assessed a penalty of $650 for the serious citation and no penalty for the nonserious citation. He found that Weisblatt's employees were exposed to the violative conditions and that Weisblatt neither created nor controlled the conditions. The judge noted that Weisblatt's instructions were very general and that its employees were instructed during the inspection "to make the safety determinations, and to ascertain what [the compliance officer] had to say about [Weisblatt's] specific work area." The judge concluded that apart from the general instructions, Weisblatt did not make a reasonable effort to protect its employees.

Weisblatt filed a petition for review, arguing that it did not create the hazards and could not contractually abate them and, therefore, the only means of protecting its employees was to remove them from the worksite.

Commissioner Cottine directed review of all the issues raised by Weisblatt's petition, including whether Weisblatt, as a subcontractor on a multi-employer construction site, took sufficient steps to protect its employees from safety hazards at the site.

In its brief on review, the Secretary contends that Weisblatt's general admonition to leave the worksite when conditions were unsafe was inadequately

communicated and enforced. He also argues that Weisblatt cannot divest itself of responsibility for its employees' exposure to violative conditions by delegating that responsibility to its foreman, unless it shows that its foreman received adequate training and supervision in safety matters.

II.

In allocating employer responsibility at multi-employer construction worksites, the Commission has established an affirmative defense for certain subcontractors. If a subcontractor on a multi-employer worksite neither created nor controlled a hazardous condition, it may defend against a citation by showing either (a) that its employees who were exposed to the hazard were protected by realistic measures taken as an alternative to literal compliance with the cited standard, or (b) that it did not have nor with the exercise of reasonable diligence could have had notice that the condition was hazardous. See Anning-Johnson Co., 76 OSAHRC 54/A2, 4 BNA OSHC 1193, 1198, 1975-76 CCH OSHD ¶ 26,690, p. 24,783 (No. 4409, 1976). Subcontractors are also expected to have made a reasonable effort to detect violations and to have exerted reasonable efforts to have them abated. Grossman Steel and Aluminum Corp., 76 OSAHRC 54/D9, 4 BNA OSHC 1185, 1188, 1975-76 CCH OSHD ¶ 20,691, p. 24,791 (No. 12775, 1976). In determining whether a subcontractor has made reasonable efforts, we look to its overall conduct, rather than to any single act. See Electric Smith, Inc. v. Secretary of Labor, 666 F.2d 1267, 1274 (9th Cir. 1982).

It is undisputed that Weisblatt neither created nor controlled the cited conditions. It is also unrebutted that Weisblatt had taken its employees off the worksite on six or seven occasions because of conditions on the worksite, and had complained to the general contractor about conditions on the site. Its employees, whose presence on the site gave rise to the citations, were there as an inspection party charged with determining whether conditions had improved so that work could continue. Indeed, they took advantage of the compliance officer's

presence on the worksite to ask him to examine the safety of the elevator shaft they were to work in. To find violations here would mean that an employer must issue instructions to employees he orders to inspect a multi-employer construction site that would make it nearly impossible for them to conduct such an inspection. Weisblatt's inspection party would not have been able to get to the site by using the unguarded ramp, but would have been required to report the hazard to the general or controlling contractor, and then return to the site to continue the inspection. Such an approach would place an unreasonable burden on subcontractors, and would make it difficult for them to properly evaluate a multi-employer worksite and try to have noncomplying conditions corrected. In view of all the circumstances, we conclude that Weisblatt has shown that it took reasonable steps to protect its employees.

Accordingly, the judge's decision is reversed. Citations 1 and 2 are vacated.

SO ORDERED.

Appearances:

Francis V. LaRuffa, Regional Solicitor
United States Department of Labor
1515 Broadway, Room 3555
New York, New York 10036
Attorney for Complainant
by Leslie Paul Brody, Esq., of Counsel

I. Wolf Weisblatt
28 Gladstone Avenue
Walden, New York
For the Respondent

## DECISION AND ORDER

Ditore, J.,

## PRELIMINARY STATEMENT

Respondent contested a citation for serious violations of 29 CFR §§ 1926.500(b)(1), 1926.500(d)(1), 1926.500(d)(2) and 1926.500(e)(1)(ii), a citation for a nonserious violation of 29 CFR § 1926.501(f), and the total proposed penalty of $1,500.00, for the alleged serious violations. A hearing

was held on September 21, 1979, at New York, New York. Specifically, Respondent is charged with the failure to protect its employees from two unguarded floor openings, an unguarded open-sided floor, an unguarded runway and an unguarded stairway which exposed its employees to fall hazards, and to tripping hazards from the unfilled treads of a stairway.

## ISSUES

1. Whether one or more or all of the alleged violations existed at Respondent's workplace on April 19, 1979 at 21 East 63rd Street, New York, New York.

2. If a violation or violations existed, whether Respondent's employees were exposed to the hazard or hazards created by the violation or violations.

3. If Respondent's employees were exposed, whether the hazards or hazards created were serious.

4. If the hazard or hazards were serious, whether Respondent knew of, and was responsible for, the violation or violations.

5. If Respondent was responsible, whether the penalty or penalties proposed were proper.

## STATEMENT OF THE EVIDENCE

On April 19, 1979, pursuant to a complaint, Compliance Officer, Alfred Fisher of the Occupational Safety and Health

Administration, visited a six story office or apartment building construction site at 21 East 63rd Street, New York, New York. (Tr. 8-12) The first floor front or south side of the building was completely demolished, exposing the basement and sub-basement areas. The entrance to, and exit from, the building was by a twenty foot long, eighteen inch wide ramp from the sidewalk to the first floor. The sides of the ramp were unguarded. On either side of the ramp was a drop of five to twelve feet to the cement basement. (Tr. 12,21,26-33; Exhs. C-2,C-3) The ramp lead to the east side of the first floor, adjacent to the wall of an elevator shaft. From this area, an employee had to walk some twelve feet along or near the edge of an open-sided floor to reach the main area of the first floor. The open side was unguarded, exposing a drop of twelve to twenty-four feet to the concrete basement. (Tr. 21,22; Exh. C-2) The ramp and open-sided floor area were the only means of employee access to, and egress from, the building. (Tr. 24; Exhs. C-2,C-3)

At the east rear side of the first floor was an unguarded floor opening, eighteen inches by six feet, exposing a drop of twelve feet to the cement basement. A skid of elevator weights were stored close to the edge of the floor opening. Another unguarded floor opening, twenty-four inches by ten feet, was located at the northwest side of the first floor, exposing a twelve foot drop to the cement basement. Employee access to the upper

floors of the building was either by an east side stairwell, six to eight feet from the unguarded east side floor opening, or by a fire escape at the rear of the building, twelve feet from the east side floor opening and fifteen feet from the unguarded northwest floor opening. (Tr. 14-18, 19-21; Exh. C-1, east side floor opening)

The east side interior stairwell which gave access to the upper floors and to the basement was forty-two inches wide with one open side not guarded by handrails. The treads of the stairs from the second to the third floors were not filled in. (Tr. 33-37,38,41; Exhs. C-4, C-5)

The lack of handrails on the stairwell created a fall hazard of eight feet, and on the stairwell between the second and third floors, the fall hazard was compounded by a tripping hazard from the unfilled stair treads. (Tr. 34,38,39)

Officer Fisher arrived at the worksite on April 19, 1979, about 8:30 a.m. and had an opening conference on the first floor with Respondent's foreman, Mr. Magni. Respondent had two employees at the site, Mr. Magni and a helper. They had returned to the job at 8:00 a.m. that morning after being off the job for ten days. (Tr. 12,13,49) Officer Fisher observed the unsafe conditions stated above, and informed Magni of them. Magni stated that he and his helper came back to the site to observe conditions. He admitted they had to use the unguarded ramp and open-sided

floor to reach the first floor, had to go by unguarded floor openings, and had to use the east side stairwell to reach the upper floors. (Tr. 13,14,15,17,24,32,42,44,56,65)

Mr. Magni requested Officer Fisher to inspect their elevator shaft workplace. Officer Fisher found their workplace properly guarded (Tr. 13,16,44,68) When Officer Fisher informed Mr. Magni of the hazards he and his help were exposed to, Mr. Magni stated he would contact his office. (Tr. 43)

Respondent's two employees were not performing work at the site from 8:30 a.m. when Officer Fisher spoke to them, until after lunch time when Officer Fisher located them at their fourth floor workplace. (Tr. 55,67) Respondent did not create the hazards observed or control the areas where the hazards were located. (Tr. 48,49)

Officer Fisher believed that the unguarded floor openings, the unguarded ramp and open-sided first floor, and the lack of handrails and tread fillings on the east side stairwell exposed Respondent's two employees to fall hazards which could seriously or fatally injure the two employees. (Tr. 16,17,24,25,29,34,35,39) He proposed adjusted penalties of $350.00 for the floor opening hazards, $400.00 for the unguarded open-sided floor hazard, $400.00 for the unguarded ramp hazard, $350.00 for the stairwell fall hazard, and no penalty for the unfilled treads hazard. (Tr. 18-19, 27-28, 32, 36)

Mr. Wolf Weisblatt, Respondent's President, stated Respondent's employees are instructed to inspect their worksite to determine if it is a safe place to work. The safety determine is left to the judgement of its foreman. Mr. Magni called his employer after speaking with Officer Fisher. Mr. Magni was told by his supervisor to stay at the site, to ascertain what Officer Fisher had to say about their work area, and to make a determination as to the safety of the work site. Respondent was informed by Mr. Magni that it would be cited, and that the general contractor was taking steps to correct the violations. Although the two employees should have left the work site, they returned to work in the afternoon. (Tr. 74-77,81,83) The general contractor had abated the ramp violation by 4:00 pm of the inspection day. (Tr. 59,64)

## OPINION

The evidence is undisputed and clearly establishes that the four serious violations and the one nonserious violation existed at Respondent's workplace on April 19, 1979. The evidence also establishes that two of Respondent's employees were exposed to the hazards created by the violations; and that Respondent did not create the hazards, or control the areas where the hazards existed.

Respondent in its letter of October 22, 1979, treated as a post-hearing brief, contends that Respondent instructed

its employees to leave a worksite where safety hazards exist; that its two employees at the East 63rd Street worksite, disobeyed this instruction on April 19, 1979, and subjected themselves to the hazardous working conditions, when they entered the worksite in the morning, when they met with Officer Fisher pursuant to Fisher's instructions, at their elevator installation workplace on the fourth floor, and when they started working in the early afternoon on the assumption that the general contractor was correcting all the violations. Respondent admits that its two employees recognized the hazards but disobeyed Respondent's instructions to leave the unsafe worksite, thereby exonerating Respondent from any responsibility.

Respondent's contention that it is not responsible for the unsafe working conditions at the site because its two employees disobeyed Respondent's instructions, is without merit and is not supported by the evidence.

At the hearing, Respondent admitted it left the determination of whether a worksite is safe or not, to the judgement of its foreman. Respondent cannot divest itself of responsibility by delegating to its foreman the responsibility of determining a worksite's safety. The foreman's determination is Respondent's determination. Respondent is responsible if the foreman's judgement is erroneous.

Further the evidence establishes that Respondent's foreman, Mr. Magni, was informed by his supervisor to stay at the worksite, to make the safety determinations, and to ascertain what Officer Fisher had to say about Respondent's specific work area. Officer Fisher did not request Respondent's employees to stay at the site, and did not request to meet them at their fourth floor worksite. The employees, pursuant to their supervisor's instructions, requested Officer Fisher to inspect their fourth floor worksite.

There is no evidence other than the general instructions given its employees, that Respondent made any reasonable efforts to protect its employees from safety hazards they might encounter at this or any other construction worksite. Respondent knew of the violations and is responsible for them.

The four violations arising from the two unguarded floor openings, the unguarded ramp and open-sided floor, and the lack of handrails on the east stairwell, were serious in that the hazards created by the violations exposed Respondent's two employees to fall hazards of eight to twenty feet. If an accident occurred to the employees because of the hazards, it was more likely then not that the employees could suffer serious physical harm.

The gravity of the violations were moderate to low. The hazards existed in areas to which the two employees had access, and used to reach or leave their work stations. The two men although present on the site, did not work during the morning hours. They commenced their elevator installation work after lunch while the ramp violation was being abated.

Under all the circumstances, including the gravity of the violations and a consideration of the statutory factors of Section 17(j) of the Act, the proposed penalty for the serious violation of 29 CFR § 1926.500(b)(1) is reduced to $100.00; the proposed penalty for the serious violation of 29 CFR § 1926.500(d)(1) is reduced to $200.00; the proposed penalty for the serious violation of 29 CFR § 1926.500(d)(2) is reduced to $200.00; and the proposed penalty for the serious violation of 29 CFR § 1926.500 (e)(1)(ii) is reduced to $150.00. The proposed penalty of zero for the nonserious violation of 29 CFR § 1926.501(f) is proper.

## FINDINGS OF FACT

The credible evidence and the record as a whole establishes preponderant proof of the following specific findings of fact.

1. Respondent, Weisblatt Electric Company, Inc., maintains an office and place of business at Route 208, Post Office Box WE, Maybrook, New York.

2. Respondent is in the elevator installation business and admits its business affects commerce.

3. On April 19, 1979, Respondent was the elevator installation contractor at a six story office or apartment building construction site, at 21 East 63rd Street, New York, New York.

4. Respondent had two employees at the site, a foreman and a mechanic.

5. Respondent admits and does not dispute that the violation set forth in the serious and nonserious citations, and the hazards created by the violations existed at the worksite on April 19, 1979.

6. Respondent did not create the hazards, or control the areas where the hazards existed.

7. Respondent's specific work areas on the site were safe and properly guarded.

8. Respondent delegates the responsibility to its employees to inspect a worksite and determine its safety.

9. Respondent having delegated the authority and responsibility to its foreman at the worksite, to determine the safety of the site, cannot divest itself of responsibility if its foreman's judgement or determination is erroneous.

10. Respondent is responsible for the violations.

11. There is no evidence other than the general safety instructions to its employees, that Respondent made any reasonable efforts to protect its employees from the hazards at the site.

12. Respondent's two employees were exposed to fall hazards of eight to twenty feet created by the violations.

13. If a fall accident occurred to Respondent's employees because of the serious hazards, it was more likely then not that the employees could suffer serious physical harm or death.

14. The gravity of the serious violations was moderate to low.

## CONCLUSIONS OF LAW

1. Respondent is, and at all times material herein was, engaged in a business affecting commerce within the meaning of Section 3(5) of the Act (29 U.S.C. § 652(5)).

2. The Occupational Safety and Health Review Commission has jurisdiction over the subject matter and parties to this action.

3. On April 19, 1979, Respondent was in serious violation of 29 CFR §§ 1926.500(b)(1), 1926.500(d)(1), 1926.500(d)(2) and 1926.500(e)(1)(ii), and in nonserious violation of 29 CFR § 1926.501(f).

4. Under the circumstances of this case with due consideration of the statutory factors of Section 17(j) of the Act, the proposed penalties for the serious violations are reduced as follows:

a. The violation of 29 CFR § 1926.500(b)(1) to $100.00.
b. The violation of 29 CFR § 1926.500(d)(1) to $200.00.
c. The violation of 29 CFR § 1926.500(d)(2) to $200.00.
d. The violation of 29 CFR § 1926.500(e)(1)(ii) to $150.00.

The proposed penalty of zero for the nonserious violation of 29 CFR § 1926.501(f) is proper.

## ORDER

Due deliberation having been had on the whole record, it is hereby

ORDERED that the citation (no. 1) for serious violations of 29 CFR § 1926.500(b)(1), 1926.500(d)(1), 1926.500(d)(2) and 1926.500(e)(1)(ii) is affirmed, it is further

ORDERED that the total proposed penalty for the serious violations as allocated in paragraph 4 of the Conclusions of Law, is reduced from $1,500.00 to $650.00, and as reduced, is affirmed, it is further

ORDERED that the citation (no. 2) for a nonserious violation of 29 CFR § 1926.501(f), and the zero penalty proposed are affirmed.

ORDER OF REMAND

This case is before the Commission on remand from the United States Court of Appeals for the Eighth Circuit. The court reversed a decision by former Administrative Law Judge Brenton vacating a citation that alleged a violation of 29 C.F.R. § 1910.23(c)(1). The court held that the cited surfaces were "platforms" within the meaning of 29 C.F.R. § 1910.21(a)(4), ordered that the citation be affirmed, and remanded for further proceedings consistent with its opinion. On rehearing, the court held that because Judge Brenton had not made findings on whether the violation was de minimis, it would not consider whether the citation should be affirmed as de minimis. It stated that on remand initial findings may be made on that matter. Donovan v. Anheuser-Busch, Inc., 666 F.2d 315 (8th Cir. 1981), reh'g denied, 666 F.2d 328 (1982). The case is remanded to the Chief

Administrative Law Judge for further proceedings consistent with the opinions of the court.

SO ORDERED.

FOR THE COMMISSION

## STATEMENT OF THE CASE

This case involves the intermittent presence of laboratory technicians, maintenance, and production personnel on top of pasteurizers about six feet above the floor in the performance of certain duties assigned to them during the production of canned beer.

Inspection of respondent's Jacksonville, Florida, brewery on May 1, 1979 through May 7, 1979, by complainant pursuant to the Occupational Safety and Health Act of 1970, resulted in a citation for a §5(a)(2) of the Act non-serious violation. Respondent contested a portion of that citation.

After a complaint and an answer were filed, the case was heard in Jacksonville, Florida, on January 31, 1980.

## THE CHARGE

That top of pasteurizers, units 10, 20, 50, and 70, were open-sided floors or platforms four feet or more above adjacent floor, upon which employees entered for inspection purposes on a routine predictable and scheduled basis with approximate daily exposure to those open sides [29 C.F.R. 1910.23(c)(1)].

## THE STANDARD

Provides that every open-sided floor or platform four feet or more above adjacent floor or ground level shall be guarded by a standard railing [or its equivalent].

## JURISDICTION

Respondent by its answer to the complaint conceded it is engaged in a business affecting commerce.

## ISSUES

Whether the tops of the pasteurizers in issue are platforms within the meaning of complainant's definition of a platform (29 C.F.R. 1910.21(a)(4))?

If the tops should be construed as platforms, whether the exposure is de minimis?

## RESERVED RULING ON MOTION

Respondent objected to receiving evidence on any work related matters not directly connected with the inspection of spray headers as alleged in the citation. Ruling on that objection was reserved to this point in time. Respondent was not taken by surprise and was well aware of the expanded situation. Accordingly, the evidence objected to is allowed to stand of record in this case.

## FINDINGS OF FACT

The material facts are not disputed. Each can-line pasteurizer is approximately six feet in height, 100 feet in length, and 25 to 30 feet in width. The top is essentially flat and consists of stainless steel lids [plates]. Each is five feet in length and two feet in width. They are laid out in nine parallel rows, each row containing 18 plates. Each plate is equipped with an L shaped lifting handle. Fixed ladders with guardrails are provided for ascent and descent to and from the top of each pasteurizer.

Cans are fed into one end of a pasteurizer and are discharged out the opposite end. Aluminum logs are placed on the conveyor belt to separate beer destined for Georgia from beer destined for Florida [to indicate changes in lid type or crown changes]. As those logs are discharged, they are placed on top of the pasteurizer at the discharge end. These logs [bars] are about ten feet in length and weigh six to eight pounds. At periodic infrequent intervals an employee will ascend the top and carry the logs down the middle and place them at the discharge end. In the performance of that operation, the employee is never closer than ten feet to the perimeter of the pasteurizer. Occasionally, a foreman requests an employee to ascend the top to open a lid to observe the progress of the logs so as to determine when they will reach the discharge end. Those two operations require ten minutes per day.

The tops of the pasteurizers are washed and mopped once each week. One employee is engaged in this operation for over an hour using a broom and a mop with a handle five feet in length. His exposure to the perimeter, if any, is miniscule.

Maintenance personnel may ascend the top of a pasteurizer to repair spray heads. At such time, the operation of the pasteurizer is shut down. In the performance of his work the mechanic is usually standing down inside the pasteurizer up to his hips. This kind of operation can occur once or twice a week, usually on week ends when the pasteurizers are shut down.

Among other duties, laboratory technicians check spray headers in the pasteurizers. Each can-line pasteurizer is so inspected at two weeks intervals. The operation is performed on top of the pasteurizer by two laboratory technicians. One raises each lid or plate by using a hook and the other views the spray heads and makes a record of the inspection. The several technicians testifying estimated the time engaged in this operation from 40 to 60 minutes and about one-fifth of that time would be spent near the perimeter. Exposure near the perimeter, not nearer than 30 inches, averages between eight and twelve minutes per technician every two weeks.

The pasteurizers are not equipped with perimeter guardrails and no other equivalent protection is provided to guard against falls from the perimeter.

No employee, required to ascend to the top of a pasteurizer to perform those tasks, as set forth above, operates production machinery or equipment of any kind whatsoever.

During the 11 or 12 years this facility of respondent's at Jacksonville, Florida, has been in operation, no employee has ever fallen from the perimeter of any pasteurizer.

## LAW AND OPINION

In this case, complainant structured his citation conforming in part to the law as pronounced by the United States Court of Appeals for the Second Circuit in General Electric Company v. Occupational Safety and Health Review Commission, 583 F.2nd 61 (1978). This is evidenced by the fact that he confined his charge to employees required to be present on the pasteurizer "on a routine predictable and scheduled basis" for inspection purposes. That, of course, refers to the laboratory technicians but ignors the fact that the Second Circuit confined the elevated working space to one designed primarily for the operation of machinery and equipment.

This case arises within the jurisdiction of the United States Court of Appeals for the Fifth Circuit, thus, the Review Commission is not bound to follow the law of the Second Circuit as laid down in General Electric Company v. OSHRC, supra.

At this point in time a consensus among the commissioners does not exist with respect to a clear and unified interpertation of the true meaning of the complainant's codified definition of "platform." That definition is:

> "A working space for persons, elevated above the surrounding floor or ground, such as a balcony or platform for the operation of machinery and equipment." (29 C.F.R. 1910.21(a)(4)).

Complainant argues that the Second Circuits' interpretation of complainant's definition of "platform" is restrictive only to a worker's presence on a flat surface merely for the performance of infrequent maintenance functions. That argument is based upon a footnote to that decision (pages 66 and 67, note 9). Complainant has misread that footnote. That footnote is attached to the end of a lengthy discussion by that Court showing how surprisingly inconsistent and unpredictable the

Commission, the Commission's Administrative Law Judges, and OSHA's compliance officers have been with regard to the definition of the term "platform." That court in that footnote merely stated that the cases in its text and those cited in that note served to demonstrate the confusion generated by the term "platform." Also, that those cases show only a single thread of continuity whenever a"platform" has been found to exist, which was where workers had been assigned to do work on that surface with some regularity and the nature of the work assigned had been central to the processes of the employer.

The Second Circuit by that footnote in no way departed from its interpretation of complainant's definition of the term"platform." In view of that definition, the court described its interpretation of §1910.23(c)(1) as reasonable and said it applies:

> "Only to elevated working spaces, 4 feet or [more] above the ground level, which are designed primarily for the operation of machinery and equipment and which require employee presence on a predictable and regular basis; and not to spaces where only occasional maintenance or repair work is performed."

That court further said:

> ". . . . to depart from this interpretation of the standard is to venture into unreasonableness."

Complainant further argues that the surface of each pasteurizer is a machine in operation where employees monitor the operation and use equipment to make repairs. Complainant concedes that the pasteurizer is non-operating during repair work. During the monitoring [inspection of spray headers] the pasteurizing machinery, all of which is enclosed below the top or surface of the pasteurizer, is in automatic operation. No employee operates the pasteurizer when engaged in an activity on top of the pasteurizer, nor is he required to operate any machinery on

that surface (Tr. 49). The only equipment used or operated on that surface was a bucket, mop, broom, a hook to lift lids, recording paper and pencil, mechanical tools and welding equipment for repairs, and aluminum logs. None of that equipment was permanently affixed to the surface of the pasteurizer nor was that surface, used to perform the work as described by the evidence, designed primarily for the operation of such equipment.

Obviously, had the Second Circuit in the General Electric Company case, supra, included in its interpretation of the application of the cited standard,"any work assigned to be performed on a platform with some regularity which in its nature is central to the process of producing [beer]," the case for complainant would be made. Should the Review Commission, however, elect to live with the rational of the court's interpretation of the cited standard, as set forth on page 65 of its decision and as quoted above, the opposite result would occur.

In this tribunal's view, the interpretation of the application of the cited standard, handed down by the Second Circuit, makes sense. If the fashioners of the standard intended that open sides of every conceivable elevated floor or platform [4 feet or more], where any kind of work is performed, be equipped with a standard railing, they would not have included the words of limitation in their definition of the term "platform."

Moreover, even if the theory of the single thread of continuity of the Commission decisions is followed, it can and probably would produce the same result which was appealed to the Second Circuit in the General Electric Company, case, supra. The point is that any or almost any work activity performed on an elevated surface could be adjudged central to the work processes of the employer.

Under that theory, assuming that mopping was the only work activity performed on the top of the pasteurizers, it could be argued in this case that mopping the top was central to the production of beer because of the necessity to keep the top sanitary in the pasteurizing process. To find that the tops of these pasteurizers were designed to receive and operate a bucket, a broom, and a mop would be ridiculous. The theory makes no case for the aluminum bars [logs] and the maintenance men and their equipment. With regard to the inspections, the tops were designed for access to the spray headers for repairs and maintenance. The handles on each lid provided ready access at a desired location. The handles attached to the lids as part of the top were not designed for the operation of the hooks used by the inspectors but rather the hooks were designed for easy lifting of the lids and save bending and stooping.

Circumventing the true meaning of the term "platform" as defined by the standard [29 C.F.R. 1910.21(a)(4)] only leads to endless ramifications in its application with preposterous results.

Moreover, this tribunal would observe that if the Secretary believes every open-sided floor or platform elevated four feet or more must be guarded by a standard railing, as required by the cited standard, then it is perfectly obvious that he should delete his definition of the term "platform" from the regulations.

The portion of the citation contested should be vacated. With that determination, the de minimis use raised by complainant is moot.

## CONCLUSIONS OF LAW

1. The Review Commission has jurisdiction to hear and decide this case.

2. The cited standard [29 C.F.R. 1910.23(c)(1)] applies only to elevated working spaces four feet or more above adjacent floor or ground level, which

require employee presence for the operation of the machinery and equipment for which it was designed.

3. Respondent's pasteurizer tops, units 10, 20, 50, and 70 were not platforms [working spaces] within the meaning of complainant's definition of the term platform [29 C.F.R. 1910.21(a)(4)].

4. Under the facts and circumstances of record in this case, the cited standard does not apply to the surfaces [tops] of respondent's pasteurizers, units 10, 20, 50, and 70.

## ORDER

Citation 1 is vacated as to tops of pasteurizers; units 10, 20, 50, and 70.

No penalty is assessed.

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

## NOTICE OF DECISION

Secretary of Labor v. Exeter Drilling Northern, Inc.,
OSHRC Docket No. 80-0496 & 80-1483 (Cons.)

1. Enclosed is a copy of my decision. It will be filed with the Commission on 4/19/82, and will become the final order of the Commission on 5/19/82, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is 5/19/82. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Quentin P. McColgin

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>EXETER DRILLING NORTHERN, INC.,<br><br>Respondent. | OSHRC DOCKET NOS.<br>80-0496 & 80-1483<br>(Consolidated) |

APPEARANCES:

Eugene F. DeShazo, Esquire, of Kansas City, Missouri
for Complainant,
David M. Berrett, Esquire, of Denver, Colorado
for Respondent.

DECISION AND ORDER

Quentin P. McColgin, Administrative Law Judge: This is a proceeding under §10(c) of the Occupational Safety and Health Act of 1970 (the Act), 29 U.S.C. §659(c), involving alleged violations of §§5(a)(1) and 5(a)(2) of the Act, 29 U.S.C. §§654(a)(1) and (a)(2).*/ The jurisdictional issues are admitted in the pleadings.

---

*/ "Each employer--(1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees; (2) shall comply with occupational safety and health standards promulgated under this [Act]."

These cases were consolidated because both involve the common issue of whether respondent's failure to provide an automatic up-travel limiting device on the drawworks on its oil drilling rigs constituted a violation of the so-called "general duty clause." The other issue, which concerns Docket 80-1483 exclusively, is whether the failure to use a kelly bushing guard violates the machine guarding standard of 29 C.F.R. §1910.212(a)(1).

A hearing in this matter was held September 10-12, 1980. No appearance was made on behalf of the affected employees or any of them. At the conclusion of the case-in-chief, respondent moved for a dismissal of the actions and the underlying citations. Following argument on this motion, it was taken under advisement. Thereafter, respondent submitted its defense. Complainant declined to submit any evidence on rebuttal. Complainant further declined to make closing argument, indicating that he would rely upon his brief. Respondent elected to make closing argument indicating that it would also submit briefs. Thereafter, both parties submitted briefs in support of their respective postions. Respondent filed with its brief proposed findings of fact and proposed conclusions of law. Additionally, both parties filed reply briefs.

Having heard and observed the witnesses and having considered the testimony and other evidence together with the pleadings and arguments presented in this matter, the undersigned hereby issues the findings, conclusions and order set forth in this decision. To the extent that the proposed findings of fact or proposed conclusions of law have not been adopted in this decision they were rejected as being inaccurate or unnecessary to the disposition of this case. To the extent that there are any pending motions which have not been specifically granted herein, such motions are denied.

## DISCUSSION

### Alleged General Duty Violation

To establish a violation of the general duty clause, the Secretary must prove (1) that the employer failed to render its workplace free from a hazard which was (2) recognized, (3) the occurrence of an incident was reasonably foreseeable, and (4) the likely consequence in the event of an incident was death or serious physical harm to its employees. Wertern Massachusetts Electric Co., 9 BNA OSHC 1940, 1981 CCH OSHD ¶25,470 (No. 76-1174, 1981); (Bomac Drilling, Division of TRG Drilling Corp., 9 BNA OSHC 1681, 1981 CCH OSHD ¶25,363 (No. 76-0450, 1981). The Secretary must also show (5) that there was a feasible means of abating the hazard. National Realty and Construction Co. v. _____ F.2d 1256 (D.C. Cir. 1973). Based upon this record, the charge cannoth be sustained because the evidence does not establish that respondent's workplace would be rendered any more free of the hazard by adopting the method of abatement proposed by the Secretary than it is by using respondent's existing method of abatement.

The specific allegation in Docket No. 80-0496 is:

> Section 5(a)(1) of the Occupational Safety and Health Act of 1970: The employer did not furnish employment and a place of employment which were free from recognized hazards that were causing or were likely to cause death or serious physical harm to the employees in that:
>
> > An automatic up-travel limiting device (cut-off) was not installed on the drawworks of the Exeter rig #22, located at Little Berthod #1, Highway 44 and I-25 in Weld County, to prevent running the traveling block into crown.

The specific allegation in Docket No. 80-1483 is:

> Section 5(a)(1) of the Occuaptional Safety and Health Act of 1970: The employer did not furnish employement and a place of employment which were free from recognized hazards that were causing or were likely to cause death or serious physical harm to the employees in that:

An automatic up-travel limiting device (cut-off) was not installed on the drawworks of the Exeter rig #2 located off Highway 79, four miles north of Bennett, Colorado.

## Description of Rig Hoisting System*/

The drawworks, traveling block, and crown--more properly, crown block--are parts of the hoisting mechanism of a drilling rig which are used to raise and lower the massive weights required to be hoisted during the course of drilling operations. The crown block and the traveling block operate as a dual system of pulleys. The crown block is stationary. It is suspended from the top of the drilling rig (the mast) and is connected to the traveling block by a wire rope (the drilling line) which is wrapped around four pulleys or sheaves in each block. By letting out or drawing in the drilling line, the traveling block can be raised or lowered from as high as the very bottom of the crown block to as low as the rig floor.

The mechanism which lets out and draws in the drilling line is the drawworks. It is a large, heavy object which is situated on the rig floor. It consists of a revolving drum around which the drilling line is spooled or wrapped. It contains various clutches and gears to spool in or let out the drilling line at various speeds. It also contains a main brake which has the ability to stop the drum from turning.

When heavy loads are being raised or lowered, the main brake is assisted by an auxiliary brake to help absorb the momentum created by the heavy loads. If the drilling line is drawn in to the point where the traveling block is immediately below the crown block, and if pressure is still being applied to draw in the drilling line, the drilling line can be expected to become severed. This will cause the

---

*/ Source: Excerpt from A Primer of Oil-Well Drilling, 4th Ed. 1979. (C-8)

drilling line to unravel from the sheaves of the crown block and the traveling block and the latter, which weighs 10,000 pounds, will then come crashing from the area of the mast to the rig floor.

It is important to recognize that it takes a combination of two conditions to cause the severing of the drilling line, and the consequent fall of the traveling block. First, the traveling block must be drawn to its utmost position so that it is in effect stationary. (Tr. 44-45, 48)*/ This occurs when the traveling block is immediately below the crown block, or in the parlance of the industry, when the traveling block "hits the crown block." (Tr. 351) Second, there must be continued pressure being applied to draw in the drilling line. Absent such pressure, there would appear to be no danger of the line severing. (Tr. 353) The hitting of the crown block by the traveling block is called "double-blocking." (Tr. 352) It is clearly a hazard recognized by both the industry and respondent. (Tr. 26, 350) Indeed, to protect against this hazard, respondent installs on its rigs heavy blocks of timber made of oak which are suspended below the crown block and which act to cushion the impact of the traveling block in the event of double-blocking and also serve as an audio warning device in such event. (Tr. 351)

Complainant proposed a different method of protection than that used by respondent. Complainant argues that respondent should use an upward-limit travel switch such as the device which is sold under the trade name Crown-O-Matic. (Tr. 48-51, C-4) This device operates to automatically stop the drum contained in the drawworks from spooling. (Tr. 102) This device is presented as a fail-safe method of preventing the recognized hazard of double-blocking from occurring. (Complainant's Brief at 2) However, after reviewing the conflicting

---

*/ The following abbreviations shall be used:
Tr. - Transcript page number
C - Complainant's Exhibit
R - Respondent's Exhibit

evidence on this issue, it is found that such device does not provide complete protection against double-blocking; therefore, it does not render respondent's workplace free from the recognized hazard.

Evidence was elicited from Mr. Matthews, a compliance officer with the Occupational Safety and Health Administration (OSHA), that the installation of a limiting device would prevent the traveling block from hitting the crown block. (Tr. 58-59) Conversely, the evidence elicited from respondent's Vice-President and drilling manager, Mr. Wetterstrom, indicates that in order to perform ordinary drilling operations, the limiting device must, at certain times, be disengaged. (Tr. 359)[*/] Mr. Wetterstrom further testified that the device became inoperative in extremely cold weather and that, depending upon the clearance allowed on the device, coupled with the speed with which the traveling block was being hoisted, the limiting device could not be relied upon to prevent the traveling block from hitting the crown.block. (Tr. 382-383, 408) Finally, Mr. Wetterstrom testified that the device required constant maintenance and adjustment, making it an unreliable personnel safety device. (Tr. 357-358)

While the compliance officer testified that it was not possible for a traveling block to hit the crown block with the limiting device in place, (Tr. 58-59) it appears that his opinion on this issue is based upon a limited familiarity with drilling rig hoisting mechanisms. (Tr. 101-106) Thus, this testimony is rejected in favor of that of Mr. Wetterstrom, whose testimony was based upon a far greater experience and familiarity with the hoisting mechanisms of drilling rigs than was Mr. Matthews'.

---

[*/] The Crown-O-Matic promotional literature itself recognizes the need to so disengage the device. (C-4)

Thus, it appears that there is no abatement method which will completely prevent the hazard of double-blocking from occurring. Each of the abatement methods proposed enjoys some substantial risk of an accident occurring as a result of double-blocking, and complainant has failed to prove that its proposed abatement method is superior to that used by respondent. Indeed, based on this record, it appears that the industry and those states that have adopted specific safety regulations for the oil drilling industry consider the two abatement methods to be coequal in efficacy. (Tr. 97-98, 350, R-1 and 2) Accordingly, it is found that the evidence fails to establish the alleged general duty violations.

The Machine Guarding Standard--29 C.F.R. §1910.212(a)(1)

The remaining issue presented here is whether respondent violated the machine guarding standard by failing to guard the rotary table/kelly bushing on its rig #22.*/ This standard, 29 C.F.R. §1910.212(a)(2), provides:

> General Requirements for All Machines (a) Machine guarding--(1) Types of guarding. One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point-of-operation, incoming nip points, rotating parts, flying chips, and sparks. Examples of guarding methods are--barrier guards, two-hand tripping devices, electronic safety devices, etc.

---

*/ The specific charge is:

> 29 CFR 1910.212(a)(1): Machine Guarding was not provided to protect operator(s) and other employees from hazard(s) created by: Revolving Rotary Table/Kelly Bushing located on the drilling platform of Exeter Rig #22 at Little Berthod #1, Highway 44, East at I-25, in Weld County.

29 C.F.R. §1926.300(b)(2) was initially pled as an alternative violation; however, complainant withdrew this alternative pleading during the hearing. (Tr. 34)

## Description of Rotating Machinery*/

The exposed pieces of rotating machinery that are involved here consist of the kelly, the kelly bushing, and part of the rotary table. The kelly is a part of the drill stem which begins at the top with the swivel which is hooked onto the hook which hangs below the traveling block and which ends at the bottom with the drill bit. Below the swivel is the kelly which is a three-, four- or six-sided piece of pipe usually about 40 feet long. The kelly is attached to lengths of drill pipe or drill collars. Lengths of drill pipe are connected together and, depending upon the depth at which drilling is being conducted, can extend into the ground for thousands of feet. Finally, connected to the lowest length of drill pipe is the drill bit which actually operates to dig the hole in a rotating motion.

The other pieces of exposed rotating machinery--the kelly bushing and the rotary table--are located at the center of the rig floor. The rotary table consists of a number of different parts, most of which are located below the rig floor. The top surface of the rotary table is generally flush with the rig floor. Most of the rotary table is covered, however, a portion is not. The kelly bushing sits on top of the rotary table. It mates with the master bushing which is a part of the rotary table.

Power is transferred from the engines to the rotary table which generates a rotational motion. When the rotary table rotates, the kelly bushing also rotates. The rotation of the kelly bushing, in turn, causes the kelly to rotate, which then causes the entire drill stem to rotate.

The kelly bushing involved here is a Baash-Ross kelly bushing of the 2-RCS series. (Tr. 436) It and the Varco kelly bushing are the two principal types

*/ Sources: Excerpt from A Primer of Oil-Well Drilling, 4th Ed. 1979 (C-8) and opening statement by respondent which was stipulated as accurately describing an oil rig and its function. (Tr. 21-26, 31)

of kelly bushings used in drilling operations. (Tr. 439) The Baash-Ross kelly bushing involved here is 17 and 1/2 inches in diameter and 24 inches high. It weighs between 1300 and 1500 pounds. (Tr. 507) It is considered by the industry to be the new type of kelly bushing which the industry considers smooth, as distinguished from the old type kelly bushing that contained J-bolts that protruded from its surface. (Tr. 246)

While there are indentations and protrusions on this kelly bushing, they are recessed and rounded so that the sides present a slightly rounded, hemispherical surface and a generally flat surface on top. (Tr. 439, C-6) Its surface is such that it is not likely to catch a chain or a hose, but if such an object were to wrap around the bushing while it is rotating, it would seize the object and cause it to continue to wrap.*/ (Tr. 337-338, 410, 452-457, 500-501).

Two additional terms pertaining to the issues presented here are the "rat hole" and the "mouse hole." The "rat hole" is a pipe upon which the kelly bushing sits when it is disengaged from the master bushing. This pipe is elevated from the rig floor so that the kelly bushing is actually overhead when the crew is working on the rig floor. The "mouse hole" is an opening in the rig floor where lengths of drill pipe are stored.

Complainant's theory of violation is that respondent violated the machine guarding standard by failing to provide a kelly bushing guard. (Tr. 15) As articulated by complainant, the failure to provide such guard resulted in exposing respondent's employees to the hazards of two pieces of rotating machinery, namely, the kelly bushing and the exposed portion of the rotary table. (Tr. 15-16) The hazard of the rotary table is described as:

---

*/ The compliance officer who conducted the inspection, Mr. Matthews, opined that the kelly bushing could catch a chain in its indentations and protuberances. (Tr. 70) However, he did not measure them nor did he attempt to find out if they actually would catch. (Tr. 70, 112)

"An employee actually stepping on . . . [the rotary table] . . . and being thrown about the table or platform." (Tr. 16)

The hazard of the rotating kelly bushing is described as:

". . . hoses, chains, and so forth that are used in this area . . . being caught by the bushing." (Tr. 16)

As is evident from the proof offered by complainant, the theory of the latter hazard is that which shall be described here as the entanglement hazard. The danger is that a hose or a chain that are generally used around the rig floor will be caught up in the rotating kelly bushing. The caught-up object could then get wrapped around an employee or one of his appendages and cause the employee to become entangled in the hose or chain that is being wrapped around the rotating kelly bushing. (Tr. 72, 213) This undoubtedly would result in serious or fatal injury--most likely either the crushing of the employee or the amputation of one or more of his appendages (Tr. 72, 213)

As a prelude to considering whether the elements of a violation have been established in this case, two observations are made concerning complainant's theory of the case. First it is observed that the guarding of the rotary table is considered by complainant to be merely incidental to the guarding of the kelly bushing itself. Secondly, it is observed that while respondent's employees are exposed to the kelly which rotates along with the kelly bushing and the rotary table, complainant does not charge respondent with violating the machine guarding standard for failing to guard that piece of machinery. Indeed, the official position with respect to the rotating kelly is, "OSHA is not intending to guard the kelly at this time." (Tr. 256) This is so even though the basic principle underlying the citation is: "Anything that is rotating, a coupler or a shaft, no matter how smooth it is, should be covered."[*/] (Tr. 215, 275)

---

[*/] Apparently OSHA does not cite drilling rig operators for failing to guard the kelly because of the difficulties of guarding that piece of machinery. (Tr. 137)

In order to establish a prima facie case that an employer has biolated the cited standard, the Secretary must show (1) the cited standard applies to the facts, (2) there was a failure to comply with the cited standard, (3) employees had access to the hazardous condition and (4) the employer knew or could have known of the condition with the exercise of reasonable diligence. Daniel International Corp., Wansley Project, 9 BNA OSHC 2027, 1981 CCH OSHD ¶25,813 No. 76-0181, 1981)

With one exception, the last three elements are clearly present here.*/ Respondent readily admits that it did not guard the kelly bushing or the exposed portion of the rotary table. Further, the evidence clearly established that one or more of respondent's employees were exposed to the hazard of the rotating kelly bushing. Finally, the evidence shows that a conscious decision was made by respondent's representatives not to guard both the kelly bushing and the rotary table; hence, respondent is charged with knowledge of the conditions.

Respondent does however challenge the applicability of the standard to its operations. This challenge is presented, in part, as a renewal of its pending motion to dismiss. Here, it is contended:

---

*/ There is, however, insufficient proof of exposure to the hazard of the exposed portion of the rotary table. As depicted in C-6, the rotary table is situated so that the possibility of someone stepping on it is remote. Furthermore, if someone were to place his foot on the rotary table while it was rotating, it would not likely throw the person into the nearby pieces of equipment. For this to occur, all the weight must be placed on the foot that is stepping on the rotary table, which is not likely to happen unless someone were literally to jump on the rotary table. Realistically, as one commences to step on the table, the rotational force of the rotary table would cause the foot to be brushed back in the direction of the rotation. (Tr. 404)

> The Secretary failed to show that a reasonably prudent person familiar with the oil drilling industry would interpret 29 C.F.R. §1910.212(a)(1), A general machine guarding standard, to require a guard over rotating portions of the rotary table and the kellybushing. (Respondent's Brief at 9)

Two arguments are presented in support of this contention. First it is argued that complainant failed to carry his burden of satisfying the "reasonable man" test which the courts have stated must be applied in interpreting general guarding standards. (Respondent's Reply Brief at 9.) Secondly, respondent argues that a reasonably prudent person familiar with the drilling industry would conclude that the general guarding standard does not require a kelly bushing guard because all but one of the administrative and court decisions preceding the citation which deal with the new style or "smooth" kelly bushings have so held. (Respondent's Brief at 12)

Neither of these arguments support the contention that the standard is inapplicable to rotating parts of oil drilling machinery. As to respondent's second argument, some of the cited cases contain express findings that the machine guarding standard is applicable to oil drilling operations, and those cases which held that the failure to guard kelly bushings was not violative of the guarding standard, base such determinations upon the estabishment of the greater hazard defense.*/

---

*/ These cases are identified and discussed <u>infra</u> at p. 19.

Thus, the prior decisions cited by respondent do not support the conclusion that the standard is inapplicable to oil drilling operations even though they may contribute to the industry's underatanding of what protective measures may or may not be required.

Respondent's first argument is also without merit. This argument is based upon respondent's misapprehension that when a general standard is involved, "it must be read to require 'only those protective measures which the knowledge and experience of the employer's industry, which the employer is presumed to share, would clearly deem appropriate under the circumstances.' (Citation omitted)" (Respondent's Brief at 10) This "reasonable employer" showing, which is superimposed upon complainant is, however, limited to those regulations which are not only general but which are also "broadly worded," such as the Personal Protective Equipment Standard of 29 C.F.R. §1926.28(a)*/. S&H Riggers & Erectors, Inc., v. OSHRC, ___ F. 2d, ____, 10 BNA OSHC 1057, 1981 CCH OSHD ¶25,733 (5th Cir. 1981). Here, the machine guarding standard is a general standard, but it is not a broadly worded standard. To the contrary, its requirements are specific by its terms. While it does not specify the particular form of guarding, it is emphatic in its requirement that guarding be provided as protection from "hazards such as those created by . . . moving parts . . ." 29 C.F.R. §1910.212(a)(1).

---

*/ This standard provides: "The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees."

Nevertheless, a compelling showing has been made in this case that the machine-guarding standard should not be applied to the oil drilling industry to require the provision of a kelly bushing guard. The basis for this determination is that OSHA has so inconsistently applied the machine-guarding standard to the oil drilling industry (more specifically to the issue of whether kelly bushing guards were required) so as to raise genuine confusion within the industry as to whether the standard applies or not. Because of this circumstance the standard, as applied to this industry, does not meet the Constitutional requirement that it carry "sufficiently definite warnings as to the prescribed conduct when measured against common understanding and practice." U. S. v. Petrillo, 332 U. S. 1, 8 (1947).

The record shows that in some regions of the United States, OSHA enforces the machine-guarding standard to the oil drilling indestry by citing rig operators for failing to guard "smooth" kelly bushings.*/ States in which the standard is so enforced include Colorado, Montana, and, more recently, Kansas. Conversely, there is unrefuted evidence that the standard is not so enforced in many OSHA regions in the country. (Tr. 481, 487, 496)

---

*/ There is evidence that the old style "J-bolt" kelly bushings are no longer used on rigs. (Tr. 272) Thus, the inconsistency of OSHA's enforcement program is confined to its policy with respect to what the industry considers to be "smooth" kelly bushings.

Before describing the other actions and inactions by OSHA which demonstrate its inconsistent policies, special consideration shall be given to the testimony of one of the compliance officers, which can be interpreted either as corroborating the evidence cited in the preceding sentence or which constitutes a separate and distinct manifestation of OSHA's inconsistent enforcement policies. This testimony is:

" Q (By Mr. Barret) Is there a kelly bushing used in the industry which is smoother than the ones that are used here?

A Yes. I don't know if they have a picture or not but there are. The sides of them are smoother.

Q If this kelly bushing were completely smooth, by your definition of smooth, would there be a violation charged?

A You've hooked me on that, sir. In Louisiana, we did use that definition for kelly bushing, required a smooth kelly bushing with any protrusion of any type where it could be hung up. We did not cite, we did cite the other. But we did not cite--let's put it this way. If it had protrusions, if there were some protrusion on the kelly bushing such as this, then we cited. In those days, that was the standard." (Tr. 133)

If this testimony were to be accepted as accurately depicting the facts, then it demonstrates the inherent inconsistency of OSHA's enforcement policy. The standard requires that all rotating parts be guarded. Yet here, Mr. Matthews claims that in Louisiana, OSHA did not require smooth kelly bushings to be guarded. The inconsistency here is that whether

smooth or not, the rotating kelly bushing can result in the entanglement hazard. (Tr. 275, 500, 540-541, C-19)

Despite this testimony that there are smoother kelly bushings than that involved in this case, it is found that there are no kelly bushings that are substantially smoother than the Baash-Ross kelly bushing that is involved here. This finding is based upon the testimony of two of respondent's witnesses who are far more experienced in drilling operations and who demonstrated a vastly superior familiarity with the industry, its problems and equipment than did complainant's two witnesses. One of these, was Mr. Wetterstrom, respondent's Vice President and drilling manager. Mr. Wetterstrom, who is a petroleum engineer with nineteen years of experience in the contract drilling industry (Tr. 347-348) testified that he was familiar with the kelly bushings that are available in the industry and that none are smoother than the Baash-Ross kelly bushing used on rig #22. (Tr. 409) The other witness, Mr. Blake, who was qualified as an expert in the field of oil field safety without objection by complainant, (Tr. 432) testified that the kelly bushing involved here was one of the two principal types of kelly bushings that were considered by the industry to be "smooth" kelly bushings.[*/] (Tr. 439) He also iddentified and described the most recent innovations in the design of kelly bushings and testified that these were no smoother than the

---

[*/] The other type was identified as the Varco kelly bushing.

kelly bushing involved here. (Tr. 437-439) Finally, he testified that there was no truly smooth kelly bushing (Tr. 439) and that he was unaware of any kelly bushing in the industry that was any smoother than the kelly bushing involved here (Tr. 485)

Having found that there is no smoother bushing than the bushing that is involved here, the most reasonable interpretation of the testimony of Compliance Officer Matthews is that OSHA does not cite oil rig operators in Louisiana for violating the general machine-guarding standard for failing to have a kelly bushing guard.*/ As so interpreted, Mr. Matthews' testimony corroborates the testimony of Mr. Blake that OSHA does not enforce the general machine guarding standard with respect to unguarded kelly bushings in several regions of the country. (Tr. 381, 487 & 496)

Additional evidence of this inconsistent enforcement policy is manifested in the statement contained in the memorandum dated June 19, 1979, from the Director, Federal Compliance and State Programs, to one of OSHA's regional administrators, which provides:

> "Kelly Bushings on oil drilling rigs that are smooth and do not present a potential hazard to employees that might come in contact with the bushings, do not require guarding. However, Kelly Bushings with projections or indentations do present a potential hazard to employees who could come in contact with the Bushing and shall be guarded or employer shall be appropriately cited." (R-6)

Since the kelly bushing involved here is as smooth as any in the industry, the most reasonable interpretation of this statement is that the kelly bushing involved here does not require a guard. Indeed, it

---

*/ This interpretation assumes that Mr. Matthews is more familiar with the enforcement policies of OSHA than he is with the physical characteristics of oil rig equipment.

is clear from this statement that this OSHA official has in mind the protection of a hazard which is quite different from the hazard involved in this case. The hazards contemplated by the Director of Federal Compliance and State Programs are those resulting from "contact" with the bushing itself, whereas the hazard noticed in this proceeding is the entanglement hazard.

Since there is unrefuted evidence in this record that contact with a kelly bushing such as that depicted in C-6 does not pose a danger (Tr. 337), it appears that the hazard contemplated by the above quoted OSHA official would not exist in this case. Indeed, the hazard contemplated by that official would ordinarily be present only in those cases involving the old-style kelly bushing with protruding J-bolts.

While the above quoted statement is clearly evidence of OSHA's inconsistent enforcement policy, it also constitutes an express statement by a responsible official of the enforcement authority, indicating a conscious decision to restrict the application of the standard to types of kelly bushings other than that which is involved here. This circumstance alone is a sufficient basis for determining that the standard is inapplicable to the so-called "smooth" type kelly bushings; even though the standard, on its face, would appear to be applicable. See Seattle Crescent Container Services, 7 BNA OSHC 1895, 1979 CCH OSHD ¶24,002 (No. 15242, 1979).

The record further shows that the standard, as applied to the oil drilling industry to require the guarding of smooth kelly bushings, is unenforceably vague. First it is shown that a number of states

wherein oil drilling is prevalent which states have approved health and safety programs do not require the guarding of "smooth" kelly bushings. (Tr. 480) These states are Utah, Michigan, Wyoming, California and Alaska. Only Wyoming's standard contains express provisions exempting kelly bushings from guarding requirements. (Tr. 480, R-1)

Secondly, all but one of the litigated cases which preceded the issuance of the citation sub judice and which involved a "smooth" kelly bushing held that such mechanism need not be guarded. Research discloses eight cases which were decided prior to the issuance of the citation sub judice involving the failure to guard kelly bushings. Two of these were based upon alleged violations of standards other than the machine guarding standard and resulted in the citations being vacated based, in whole or in part, upon the inapplicability of such other standards. DB Drilling Corporation, 78 OSAHRC 21/D2 (No. 76-4668, 1978); MND Drilling Corporation, 77 OSAHRC 183/C5 (No. 76-4149, 1977) (also greater hazard). One case, Signal Oilfield Services, Inc., 78 OSAHRC 39/D1 (No. 77-0226, 1978), which involved the old-style kelly bushing with protruding J-bolts, held that the failure to guard the kelly bushing violated the machine guarding standard. Of the remaining five cases, four vacated citations alleging violations of the machine guarding standard based upon the findings of greater hazard. Graywolf Drilling Company, 78 OSAHRC 94/A3 (No. 77-3803, 1978); Circle Bar Drilling Company, 78 OSAHRC 82/D4 (No. 77-3581, 1978)(also lack of employee exposure); Graywolf Drilling Company, 78 OSAHRC 70/F1, 1978); Hughes Drilling Company, Inc., 79 OSAHRC 58/A2 (Nos. 76-2945 & 76-3574, 1977). In only one of

these eight cases, was the alleged violation of the machine guarding standard affirmed. Fred Wilson Drilling Company, Inc. 78 OSAHRC 67/D2 (No. 77-3578, 1978). However, that decision, which is the only one reviewed on appeal, was subsequently reversed based upon a finding of greater hazard. Fred Wilson Drilling Company, Inc. v. Marshall, 624 F.2d 38 (5th Cir. 1980).

These circumstances, coupled with OSHA's own inconsistent enforcement policies wherein they selectively enforce the machine guarding standard as to kelly bushings and uniformly do not as to the kelly results in creating such confusion within the drilling industry, that the standard, as applied to this industry, does not provide sufficient warning as to its requirements. Thus, as applied to this industry, the cited standard is found to be unenforceably vague. See Diebold Inc. v. Marshall, 585 F.2d 1327 (6th Cir. 1978).

While the foregoing is dispositive of the machine guarding issue, respondent has raised two additional affirmative defenses to this charge. In order to avoid a remand should the foregoing holdings be reversed on appeal, these defenses will also be addressed.

The first affirmative defense is that of impossibility of compliance. This defense is based upon the overwhelming and unrefuted evidence of record that any guard which could be placed upon the rotating kelly bushing would present hazards to respondent's employees which hazards are separate and distinct from the hazards presented by the rotating kelly bushing. This circumstance, it is argued, makes it impossible to comply with the general requirements for machine guards as specified in 29 C.F.R. §1910.212(a)(2) which provides:

> Guards shall be affixed to the machine where possible and secured elsewhere if for any reason attachment to the machine is not possible. The guard shall be such that it does not offer an accident hazard in itself. (Emphasis added)

Despite the compelling logic of this argument, the Commission has held that Subpart (a)(2) of the standard cannot be asserted as an affirmative defense to the machine-guarding standard of subpart (a)(1). Weyerhaeuser Co., 4 BNA OSHARC 1972, 1976-77 CCH OSHD ¶21,465 (Nos. 1231 & 1758, 1977). In view of the Commission's emphatic holding on this issue, the undersigned is constrained to reject this defense even though the record here demonstrates that no guard exists and no guard can be devised, based upon the present state of the art, which do not present hazards themselves.

The final defense is the greater hazard defense. With respect to the first element of this defense, the proof establishes that the use of kelly bushing guards results in the following types of hazards:

1. Interference with the mating of the kelly bushing with the master bushing due to the visual obstruction caused by presence of the guard with consequent risk of hand or finger amputations (Tr. 479)
2. Interference of the kelly bushing guard with the tong lines, creating the possibility of the tongs being swung into a floorhand (Tr. 460 - 461)
3. The possibility that a guard made of expanded metal may catch on the kelly bushing and rotate in such a manner as to present a danger to employees (Tr. 463)
4. The possibility of the guard acting as a deflecting shield in the event of a kick coming out of the well bore (Tr. 464)

5. The possibility that pieces of the kelly bushing or the kelly bushing guard, unseen by the driller, will vibrate loose and then fall down onto the hands when the kelly bushing is raised (Tr. 424-425, 466-468)

6. The possibility of pinched fingers, toes or strained backs resulting from moving the heavy two-piece removable type guard (Tr. 469-470) or the cumbersome combination of the kelly bushing and guard in the case of the one-piece guard (Tr. 479)

7. Blocked escape routes caused by having to find space on the drill floor for a removable type guard (Tr. 472)

These types of hazard are shown to have resulted in injuries ranging from minor bruises (Tr. 465-466 & 479), fractures (Tr. 424-425), the amputation of a hand (Tr. 479) to a fatality resulting from pieces of the kelly bushing falling when the kelly bushing was obscured from view by a guard. (Tr. 466) Additionally there have been other accidents resulting in injuries which are attributable to the presence of a guard. (Tr. 307, 312-312, 315-319, R-4 & 5)

On the other hand, there is evidence of three accidents involving the entanglement of employees with one or more pieces of rotating machinery. In each case, the kelly bushing was unguarded and resulted in either an amputation or a fatality. (Tr. 171-172, 189-196, 204, C-12, C-13 and C-14). While the evidence pertaining to these accidents is far from complete and decidedly speculative, it appears that

one of these three accidents was caused by the unguarded kelly rather than the unguarded kelly bushing (Tr. 447-448, C-14) and another involved the old style kelly bushing which everyone agrees is hazardous and should be guarded. (Tr. 435-437) Only one of these three accidents involved a "smooth" type kelly bushing which could have been prevented by a guard (Tr. 277, 501).

Thus, in comparing the hazards presented by the unguarded, "smooth" kelly bushing against those of the guard itself, it is found that the "smooth" kelly bushing presents more of a hazard guarded than unguarded. Accordingly, it is found that respondent has established the first element of the greater hazard defense.

Respondent also established the second element of this defense--namely that alternative means of protection was provided. This alternative means of protection consisted of the establishment of a written work rule which prohibits employees from being on the drill floor unless the driller is at the console. (Tr. 392, 402-403) This policy would permit the driller to turn off the rotating equipment in the event someone commenced to be entangled in any of the pieces of rotating equipment including the kelly.*/

---

*/ In at least two of the three serious accidents which complainant relies upon to establish the hazards of an unguarded kelly bushing, no one was at the console when the employee became entangled. (Tr. 440; C-14. See also Tr. 449-450) It appears likely that either these accidents would not have occurred or they would not have been as serious had the console been manned when the workers commenced to become entangled.

To satisfy the third and final element of this defense, respondent argues that it could not meet the variance procedures specified in 29 C.F.R. §1905.10; therefore, it would have been inappropriate for it to have made application for a variance. Respondent argues that the variance procedures of 29 C.F.R. §1905.10 require the applicant to set forth a statement of when he expects to be able to comply with the standard and that a program exists for bringing him into compliance with such standard. Relying upon the evidence in this case that there is no effective means to guard a rotating kelly bushing, respondent argues that it could not specify in its application when compliance with the standard could be secured. Additionally, it is noted that it has been recognized that when the common understanding within a particular industry is that a particular piece of equipment need not be guarded, such circumstance alone is sufficient to show the inappropriateness of seeking a variance. Diebold Inc. v. Marshall, supra. Thus, it is found that respondent has established all three elements of the greater hazard defense.

In view of the foregoing and pursuant to Fed. R. Civ. P. 52(a) which permits the entry of judgment based upon findings of fact and conclusions of law which appear in a decision, judgment in the form of the order set forth below is hereby entered.

## ORDER

Based upon the foregoing, it is hereby ordered that:

1. Citation No. 1, Items Nos. 1 & 2, in Docket No. 80-0496, are VACATED.

2. Citation No. 1, Item No. 2, in Docket No. 80-1483, is VACATED.

Quentin P. McColgin
Judge, OSHRC

Dated: April 19, 1982

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

## NOTICE OF DECISION

S.O. Jennings Construction Corp. v. Secretary of Labor
OSHRC Docket No. 79-69

1. Enclosed is a copy of my decision. It will be filed with the Commission on April 21, 1982, and will become the final order of the Commission on May 21, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is May 21, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Date: April 1, 1982

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| S.O. JENNINGS CONSTRUCTION CORP.<br>Petitioner | |
| v. | DOCKET NUMBER 79-69 |
| SECRETARY OF LABOR<br>Respondent | |

ORDER

Motion by the Secretary to dismiss the application filed on December 31, 1981, by S.O. Jennings Construction Corp. (Jennings) for an award of fees and expenses under the Equal Access to Justice Act (Act), Pub. L. No. 96-481, 94 Stat. 2325 (1980), (codified at 28 U.S.C. § 2412, 5 U.S.C. § 504) because of lack of Commission jurisdiction to hear the case, or in the alternative for the Commission to grant and award for fees and expenses incurred either before the effective date of the Act or while the case was before the Court of Appeals is opposed by Jennings, the Petitioner.

A short history of the proceedings leading up to the application by Jennings is in order.

After an inspection of Jennings' worksite on July 18, 1978, a citation was issued to Jennings alleging three wilful violations of the trenching standards promulgated by the Occupational Safety and Health Administration, i.e., 29 C.F.R. § 1926.651(i)(1), 29 C.F.R. § 1926.652(b) and 29 C.F.R. § 1926.652(e). A timely Notice of Contest was filed, and the case was tried

before Judge Henry F. McQuade of the Review Commission from January 12-15, 1981, in Washington, D.C. Judge McQuade issued a Decision and Order on May 4, 1981, which affirmed Citation No. 1, Item 1 as a serious violation and assessed a penalty of $1,000, he affirmed Citation No. 1, Item 2 as a serious violation and assessed a penalty of $1,000, and vacated Citation No. 1, Item No. 3. In short, he found two of the items in Citation No. 1 to be serious not wilful, and vacated the third item.

The Secretary filed a petition for discretionary review with the Commission, and upon the failure of the Commission to direct review, the decision of Judge McQuade became a final order of the Commission on April 3, 1981. Section 12(j) of the Occupational Safety and Health Act of 1970, 29 U.S.C. § 661(i). On August 3, 1981, the Secretary filed a petition for review in the U.S. Court of Appeals for the Fourth Circuit. Thereafter the Secretary moved the court for dismissal of this petition which was granted. On December 4, 1981, the petition was dismissed.

The Act which went into effect October 1, 1981, provides for the award of attorneys fees and other expenses to parties who prevail over the Federal government in certain administrative and court proceeedings. Agencies holding covered adjudications are required to establish procedures for the submission and consideration of applications thereunder, said rules to be promulgated after consultation with the Administrative Conference of the United States (ACUS) so as to establish uniformity of the rules implementing the Act. Pursuant to 5 U.S.C. § 504(c)(1) the Occupational Safety and Health Review Commission promulgated interim rules implementing the Equal Access to Justice Act based on model rules issued by ACUS.

The Act establishes a thirty day limit for the filing of applications for fees and expenses. 5 U.S.C. § 504(a)(2). Section 504(a)(2), 5 U.S.C.

§ 504(a)(2) states ". . . A party seeking an award of fees and other expenses shall within thirty days of final disposition in the adversary adjudication, submit to the agency an application which shows that the party is a prevailing party and is eligible to receive an award under this section, including an itemized statement from any attorney, agent, or expert witness representing or appearing in behalf of the party stating the actual time expended and the rate at which fees and other expenses were computed. The party shall also allege that the position of the agency was not substantially justified."

The Occupational Safety and Health Review Commission in its implementing rules to the Act in Subpart C - Procedures for Considering Applications, § 2204.302(a) stated "An application may be filed whenever an applicant has prevailed in a proceeding or in a discrete substantive portion of the proceeding, but in no case later than thirty days after the Commission's final disposition of the preceeding."

Section 2204.302(d) defines "date of final disposition" as:

1) "The date on which the order of the judge disposing of the case becomes final under section 12(j) of the OSH Act, 29 U.S.C. § 661(i) or

2) "The date on which the order of the Commission affirming, modifying, or vacating the Secretary's citation or proposed penalty or directing other appropriate relief becomes final under Section 10(c) of the OSH Act, 29 U.S.C. § 659(c)."

Under Section 12(j) of the Occupational Safety and Health Act of 1970, 29 U.S.C. § 661(i) the judge's order became the final order of the Commission on June 3, 1981, inasmuch as no Commission member "directed that such report shall be reviewed by the Commission."

The Secretary argues that the Commission has no jurisdiction to consider the application filed by Jennings since the Act establishes a 30 day time limit for filing such application. I agree. Both the Act and the Review Commission's rules of procedure implementing the Act direct that any application be filed within thirty days of a final disposition.[1/] The legislative intent demonstrates that this requirement is mandatory. Thusly, the report of the House Committee on the Judiciary, in an analysis of the proposed Act explained that "a party seeking an award of fees must apply to the court within thirty days of final judgment." H.R. Rep. No. 96-1418, 96th Cong. 2d Sess. 18 (1980), reprinted in [1980] U.S. Code Cong. & Ad. News 4984, 4997 (emphasis added). The conference committee similarly "requires a party seeking an award of fees and other expenses to submit an application within thirty days of final judgment. . ." H.R. Rep. No. 96-1434, 96th Cong. 2d Sess. 26 (1980), reprinted in [1980] U.S. Code Cong. & Ad. News 5003, 5015 (emphasis added). This intent is manifest in both 28 U.S.C. § 2412.(d)(3) wherein a court may award fees and expenses and in 5 U.S.C. § 504(a) which deals with the same application at the agency level.

The Act of Congress has created an obligation which heretofore was protected by the principle of sovereign immunity. As such when the statute contains "in itself a statute of limitations, the limitation imposed becomes an integral part of the right of action created by the statute and so limits it that an aggrieved person cannot maintain his suit after the time fixed by the statute has expired." Pennsylvania Company for Insurances on Lives and Granting Annuities v. Deckert et al, 123 F.2d 979, 985 (3d Cir. 1941).

---

1/ "A final judgment is one which, if affirmed on appeal, leaves nothing to be done below other than to execute the already rendered judgment" Smith v. Sherman, 394 F.2d 547, 551 (6th Cir. 1965). It is apparent that on June 3, 1981, the Order and Decision of Judge McQuade became final.

The petition filed by Jennings for an award of fees and expenses on December 31, 1981, was filed beyond the thirty day period allowable, to wit, the filing made over five months after its due date under 5 U.S.C. 504. The jurisdictional limitations on the Commission's powers under the Act is explicit. Absent the authority to act on this application after the thirty day filing period set down by statute, the application must fail.[2/]

Accordingly, the Secretary's motion to dismiss the application before the Commission for lack of jurisdiction is granted.

Application is dismissed.

IRVING SOMMER
Judge, OSHRC

Dated: April 21, 1982
Washington, D.C.

---

2/ The contention of Petitioner that there was no final order of the Commission until the appeal was decided, thusly extending its time to 30 days after December 4, 1981, when the Court of Appeals dismissed the petition of the Secretary, is without merit.

DECISION AND ORDER

RICHARD J. MURPHY, JUDGE

A workplace under the operation and control of Respondent was inspected by the Occupational Safety and Health Administration (OSHA) on November 19, 1980. The inspection was at the bedding plant located in Respondents plant in Morenci, Arizona. As a result of that inspection a citation was issued alleging violation of the Occupational

Safety and Health Act of 1970 (29 U.S.C.651, et seq) (Act). On May 13, 1981, a formal complaint was filed which was answered by Respondent by May 26, 1981. In its answer Respondent admitted that it has employees at the Morenci plant; that it is engaged in a business affecting interstate commerce within the meaning of section 3(5) of the Act. I find and conclude that respondent is subject to the jurisdiction of this Commission pursuant to section 10(c) of the Act.

After the hearing in this case commenced on February 2, 1981, the parties reached a settlement of the issues and were granted leave to file a document setting forth the terms of the settlement. The settlement agreement dated February 4, 1982, has been considered and is approved. It is therefore ordered that the Citation, Pleadings, and proposed penalties, as modified or amended by said settlement agreement, are affirmed.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>ACKERMANN ENTERPRISES, INC.,<br><br>Respondent. | OSHRC Docket No. 80-4971 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Joe D. Sparks is before the Commission for review pursuant to section 12(j), 29 U.S.C. §661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§651-678 ("the Act"). The Secretary of Labor ("Secretary"), cited Respondent, Ackermann Enterprises, Inc. ("Ackermann"), for, among other things, a violation of section 5(a)(1) of the Act, 29 U.S.C. §654(a)(1). 1/ The citation alleged that three employees were riding in the front bucket of a tractor and were exposed to the hazard of falling or being thrown from the bucket as the tractor traveled between two buildings at Ackermann's construction site. Judge Sparks vacated the citation on the basis that all evidence of the alleged section 5(a)(1) violation was based on impermissible observations by

---

1/ Section 5(a)(1) of the Act provides:

Sec. 5(a) Each employer --

(1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

an Occupational Safety and Health Administration ("OSHA") compliance officer that occurred prior to issuance of an inspection warrant. Commissioner Cleary granted the Secretary's petition for review, particularly directing the Commission to consider the following issue:

> Whether the administrative law judge erred in excluding evidence gathered by the Secretary in support of an alleged 5(a)(1) violation on the ground that the evidence was obtained in violation of Respondent's Fourth Amendment rights?

For the reasons that follow, we reverse the judge's finding that the inspection violated the fourth amendment, and we remand the case for further proceedings.

I.

On June 10, 1980, OSHA compliance officer Robin R. Medlock was returning to Cincinnati, Ohio, on Highway 32 in Clermont County after completing an accident investigation at another facility. As Medlock passed Ackermann's construction site, he noticed two conditions that he believed were in violation of OSHA standards. 2/ After arriving at his office, Medlock was instructed by his supervisor to inspect Ackermann's worksite.

At about 12:30 p.m. the following day, Medlock arrived at the worksite, where Ackermann was in the process of erecting a four-building apartment complex. The buildings were arranged in two rows with two buildings in each row. Two buildings were under construction, and a third had some "finish-up" work to be completed, such as the placement of air conditioners. There was no evidence that any of the buildings were occupied by tenants. Medlock drove onto the site between the buildings under construction. An employee informed Medlock that no supervisory personnel were present, but that there might be someone in the worksite office. At the office, Medlock was told by Mrs. Byrd, the office secretary, that only

---

2/ Medlock testified that he observed employees on the site not wearing protective helmets. He also observed a "pump-jack" scaffold that was unguarded. No citations with respect to these conditions were issued.

Tom Ackermann, president and owner, or Jerry Westerkamp, superintendent, could authorize an inspection. Mrs. Byrd stated that neither man was at the project at that time, but Mr. Westerkamp might be back a little later. Medlock indicated that he would wait for someone to return, and Mrs. Byrd agreed.

Medlock went to the parking lot just outside the office and waited near his car. After waiting 15 to 30 minutes, he noticed three workers standing in the front bucket of a tractor. 3/ The tractor, which was also carrying lumber, made eight to ten trips between two of the buildings at the worksite. Medlock, standing in the parking lot, was approximately 300 to 350 feet away from the tractor. He observed the bucket through a zoom lens camera and took photographs. The persons in the bucket, however, were also observable by the compliance officer without the use of the zoom lens.

By approximately 3:15 p.m., neither the owner nor the superintendent had arrived, and Medlock left for the day. Two days later he returned, and again Mrs. Byrd was the only person present in the office. When Medlock asked her whether Mr. Ackermann or Mr. Westkamp had been informed of Medlock's earlier visit, Mrs. Byrd replied, "Yes, I explained that to him, . . . and he told me that he didn't want you on the property." Medlock then left the worksite.

An inspection warrant was obtained, and Ackermann's worksite was inspected pursuant to the warrant on July 7, 1980. 4/ No employees were observed riding in the front bucket of the tractor during this inspection. However, during the inspection one of Ackermann's employees admitted that he had ridden in the front

---

3/ Medlock also referred to this tractor as a "front-end loader backhoe." Medlock explained that the tractor had a bucket attachment in the front and a backhoe excavating attachment in the rear. Hereafter, this vehicle is referred to simply as a "tractor."

4/ Ackermann at the hearing conceded that the warrant for the July 7, 1980 inspection was valid.

bucket of the tractor at the time of Medlock's initial visit to the worksite on June 11, 1980.

At the hearing, Ackermann's attorney moved to exclude all evidence related to the compliance officer's observations on June 11. He contended that the evidence was secured improperly before a warrant was issued and hence constituted an illegal search under the fourth amendment.

II.

In his decision, Judge Sparks acknowledged Commission precedent that observations by a compliance officer are admissible when made from public areas such as highways. Laclede Gas Co., 79 OSAHRC 94/E13, 7 BNA OSHC 1874, 1979 CCH OSHD ¶ 24,007 (No. 76-3241, 1979). The judge, however, concluded that the "plain view" exception to the inspection warrant requirement was not applicable here, since there was no indication that the conditions observed by the compliance officer were within the view of the general public. The judge found that the parking lot next to Ackermann's office was "a private lot, not like the parking lot of a shopping center." The judge found that the compliance officer had sought and obtained permission to wait for the owner or superintendent to arrive but had not received consent to observe the activities at the worksite.

The judge, citing Marshall v. Barlow's Inc., 436 U.S. 307 (1978) ("Barlow's"), ruled that the observations of the compliance officer before he obtained a warrant were an infringement of Ackermann's fourth amendment rights. 5/ The judge therefore excluded this evidence, as well as the admission by one of Ackermann's employees

---

5/ The fourth amendment states:

> The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no Warrants shall issue, but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

that he rode in the front bucket of the tractor. The judge reasoned that the latter evidence was a fruit of the improper observations of the compliance officer and hence likewise infringed Ackermann's fourth amendment rights. Finding no untainted evidence to support the alleged section 5(a)(1) violation, the judge dismissed the citation. He did not address whether a violation would have been established if the evidence had been admitted.

III.

On review, the Secretary contends that the judge incorrectly excluded the evidence concerning the alleged section 5(a)(1) violation. The Secretary argues that no violation of Ackermann's fourth amendment rights occurred since the compliance officer was on Ackermann's property with the consent of Ackermann's agent. The Secretary also points out that the conditions observed by the compliance officer were in plain view. The Secretary further contends that no warrant was required since the compliance officer's observations came within the "open fields" exception noted in Air Pollution Variance Board v. Western Alfalfa Corp., 416 U.S. 861 (1974). Ackermann did not file a brief on review.

IV.

Under Barlow's, supra, inspections of employment premises by OSHA compliance personnel under section 8(a) of the Act, 29 U.S.C. § 657(a), are subject to the fourth amendment. Evidence obtained in violation of the fourth amendment may be excluded from Commission proceedings. Sarasota Concrete Co., 81 OSAHRC 48/A2, 9 BNA OSHC 1608, 1981 CCH OSHD ¶ 25,360 (No. 78-5264, 1981), pet. for review filed, No. 81-5621 (5th Cir. June 23, 1981).

In Barlow's, the Court ruled that, while a government inspector is free to observe what is observable by the public, he may not compel entry into a place of business from which the public is barred and conduct an inspection without a warrant. The Court, however, considered it crucial that the entry by the inspector

in Barlow's was sought over the objection of the employer. The Court thus distinguished the employer in Barlow's from "the great majority of businessmen [who] can be expected in normal course to consent to inspection without warrant." 436 U.S. at 316. Therefore, OSHA inspections fall under the general rule that there is no fourth amendment violation when consent is voluntarily given to the warrantless search or inspection. Schneckloth v. Bustamonte, 412 U.S. 218 (1973); Stephenson Enterprises, Inc. v. Marshall, 578 F.2d 1021 (5th Cir. 1978); Marshall v. Western Waterproofing Co., 560 F.2d 947 (8th Cir. 1977).

We agree with the Secretary that the observations by compliance officer Medlock did not violate the fourth amendment. Mrs. Byrd, the only employee present at Ackermann's office on June 11, 1980, assented to compliance officer Medlock's request to wait at the worksite for the return of Ackermann or Westercamp. Since Mrs. Byrd was the office secretary and was alone in the office, it is reasonable to infer that she had authority to permit a visitor to wait for the owner or superintendent to return, even though she lacked authority to permit a tour of the worksite. Indeed, no contention has been made to the contrary. We therefore are in accord with the judge's finding that Ackermann's agent consented to Medlock's presence on the parking lot. However, unlike the judge, we find that, while in the parking lot, Medlock was not barred from seeing activities and objects around him. A person who consents to an inspection or search of certain areas may deny permission for an inspector to enter other areas. See Walter v. United States, 447 U.S. 649 (1980) (dicta) (plurality opinion). However, if the inspector is granted permission to be in a particular area, his observation of objects in plain view from that area is not a constitutional violation. Harris v. United States, 390 U.S. 234 (1968); see Stephenson Enterprises, Inc. v. Marshall, supra; cf. Titanium Metals Corp. of America, 80 OSAHRC 6/A2, 7 BNA OSHC 2172, 1980 CCH OSHD ¶ 24,199 (No. 14080, 1980) (section 8(a), which is coextensive with fourth amend-

ment, not violated by compliance officers' observation of scaffold violation while on way to administration building), review denied, 636 F.2d 1211 (3d Cir. 1980). Since the tractor here was in plain view from the compliance officer's vantage point on Ackermann's parking lot, 6/ and since Medlock's presence on the lot was proper, we conclude that there was no fourth amendment violation. 7/

There is an additional basis for our conclusion that no fourth amendment violation occurred. There is no violation of fourth amendment rights when a government agent's observations occur in "the open fields," rather than in houses, commercial buildings, or other premises from which the public is excluded. Air Pollution Variance Board v. Western Alfalfa Corp., supra; Hester v. United States, 265 U.S. 57, 59 (1924); Patterson v. NTSB, 638 F.2d 144 (10th Cir. 1980). This is true even if the government agent trespasses on private property to make his observations. Ehlers v. Bogue, 626 F.2d 1314 (5th Cir. 1980); United States v. Williams, 581 F.2d 451 (5th Cir. 1978); Fullbright v. United States, 392 F.2d 432 (10th Cir.), cert. denied, 393 U.S. 830 (1968); McDowell v. United States, 383 F.2d 599 (8th Cir. 1967). Medlock's observation of Ackermann's tractor through the open terrain between two buildings from an apparently unrestricted parking area falls under this "open fields" exception. Because the tractor was readily observable from this area, Ackermann could have no reasonable expectation of privacy with respect to its operation. See Katz v. United States, 389 U.S. 347

---

6/ In finding that the observations of the compliance officer were in plain view, we hold that a worksite remains in plain view even where it is observed through a telephoto or zoom lens, and that no exclusion of the evidence obtained in that manner is required. Laclede Gas Co., supra.

7/ Chairman Rowland notes that although Medlock's testimony suggests that Mrs. Byrd specifically denied permission to inspect and only consented to Medlock's waiting for a reasonable time without conducting an inspection, Ackermann did not present sufficient evidence to establish that Medlock's observations were made of or from an area, or at a time, which exceeded the scope of consent. Inasmuch as Ackermann did not meet its burden of proof, Chairman Rowland agrees with the majority that the record does not show that Medlock's observations violated the fourth amendment.

(1967). 8/
